Corporate Philosophy: Global Presence

As a comprehensive cutting tool manufacturer, we make products that at a fundamental level contribute to enhancing people's quality of life. Through continuous growth, we have established a production, sales and technical support network spanning 33 countries.

Our corporate aim is to continue to expand our operations globally and strengthen our contribution to manufacturing industries worldwide.

Business Model

Customer communication is at the heart of the OSG brand. We anticipate, listen and actively react to customer needs through on-site face-to-face support. OSG's vast global network provides our production sites with accurate feedback about user needs so that they can quickly design, develop, manufacture and deliver products that precisely meet those needs.

shaping your dreams

The power of OSG lies in our assured innovative technological know-how for producing high-quality and high-performance products; our exceptional services to respond to situations diligently; and our out-of-the-box thinking to provide total solutions that anticipate our customers' needs. We are committed to contribute to the advancement of the manufacturing industries by shaping our customers' dreams into reality.

The Power to Exceed Customers' Expectations

VISION

Shaping your dreams through world class **innovative solutions** for the manufacturing industry.

MISSION

We bring **innovation** and **excellence** to our customers through collaborative partnerships by providing the highest quality cutting tools and cold forming products.

Message from our Leadership Team

Jeff Tennant
President of OSG USA

As the world's largest manufacturer of round cutting tools, OSG Corporation has succeeded in maintaining steady growth over the past 80 years. As we look forward to future growth, we would like to express our sincere gratitude to our customers, business partners and shareholders for their support in contributing to OSG's success.

Ever since the Company's establishment in 1938, OSG has been committed to developing quality products that truly exceed the expectations of each customer. This spirit remains alive in all facets of our operation today and has given OSG the strength to challenge the status quo and deliver products and services in sync with manufacturing needs of the times. Our corporate tagline "Shaping Your Dreams" summarizes this passion for new challenges and commitment to transforming each and every one of our customers' dreams into reality.

As the manufacturing industry is consistently transforming through the new discovery of materials and technologies, OSG is poised for continued growth by delivering new advancements and innovative products that respond quickly to evolving customer needs.

A Commitment to Quality that Withstands the Test of Time

In March 1938, Hideo Osawa established OSG Grinding Co., Ltd. to achieve domestic production of high-quality taps. Thirty years later, OSG's first overseas subsidiary was established in the United States. Based on the corporate philosophy of "global presence," OSG has since then built a production, sales and technical support network spanning 33 countries. With over 50 years of experience in developing new markets and human assets, OSG will continue its global expansion and contribute to the advancement of the manufacturing industry worldwide.

OSG's Company History

1938

Hideo Osawa established OSG Grinding Co., Ltd. in Tokyo
Began manufacturing Taps and Dies

1956

Began manufacturing and sales of Cylindrical Rolling Dies

1968

Originally established as OSG Tap & Die, Inc., the Chicago based sales office marked the first office and growth outside of Japan

1973

Acquired Sossner Tap & Die in Brunswick, GA

1983

OSG USA expands to open regional sales office in Placentia, CA

1942

Began manufacturing and sales of Screw Gages

1963

Began manufacturing and sales of Flat Rolling Dies

1970

Began manufacturing and sales of HSS End Mills

1980

Began manufacturing and sales of Carbide End mills

1984

Began manufacturing and sales of Drills

1987

Began manufacturing and sales of Cutter Bodies

1994

Established OSG Royco, S.A. de C.V. in Vellejo, Mexico

2004

OSG USA acquires Sterling Die, later merged into OSG faster division Parma, OH

The A Brand

2014

OSG Introduces "The A Brand" product brand

2016

OSG USA, Inc. acquired AMAMCO Tool & Supply Co., Inc in Duncan, South Carolina

2018

OSG Corporation Celebrates its 80th anniversary

2019

OSG USA relocates to new Headquarters in St Charles, IL

1988

Established OSG Canada in Burlington, Ontario

2001

OSG USA acquires Quality Carbide Tool, later merges into OSG Bensenville, IL

2010

Began sales of OSG Phoenix, an Indexable tooling series

2015

In 2015, To reflect the diverse array of products and services, OSG Tap & Die, Inc. officially changed our name to OSG USA, Inc.

2016

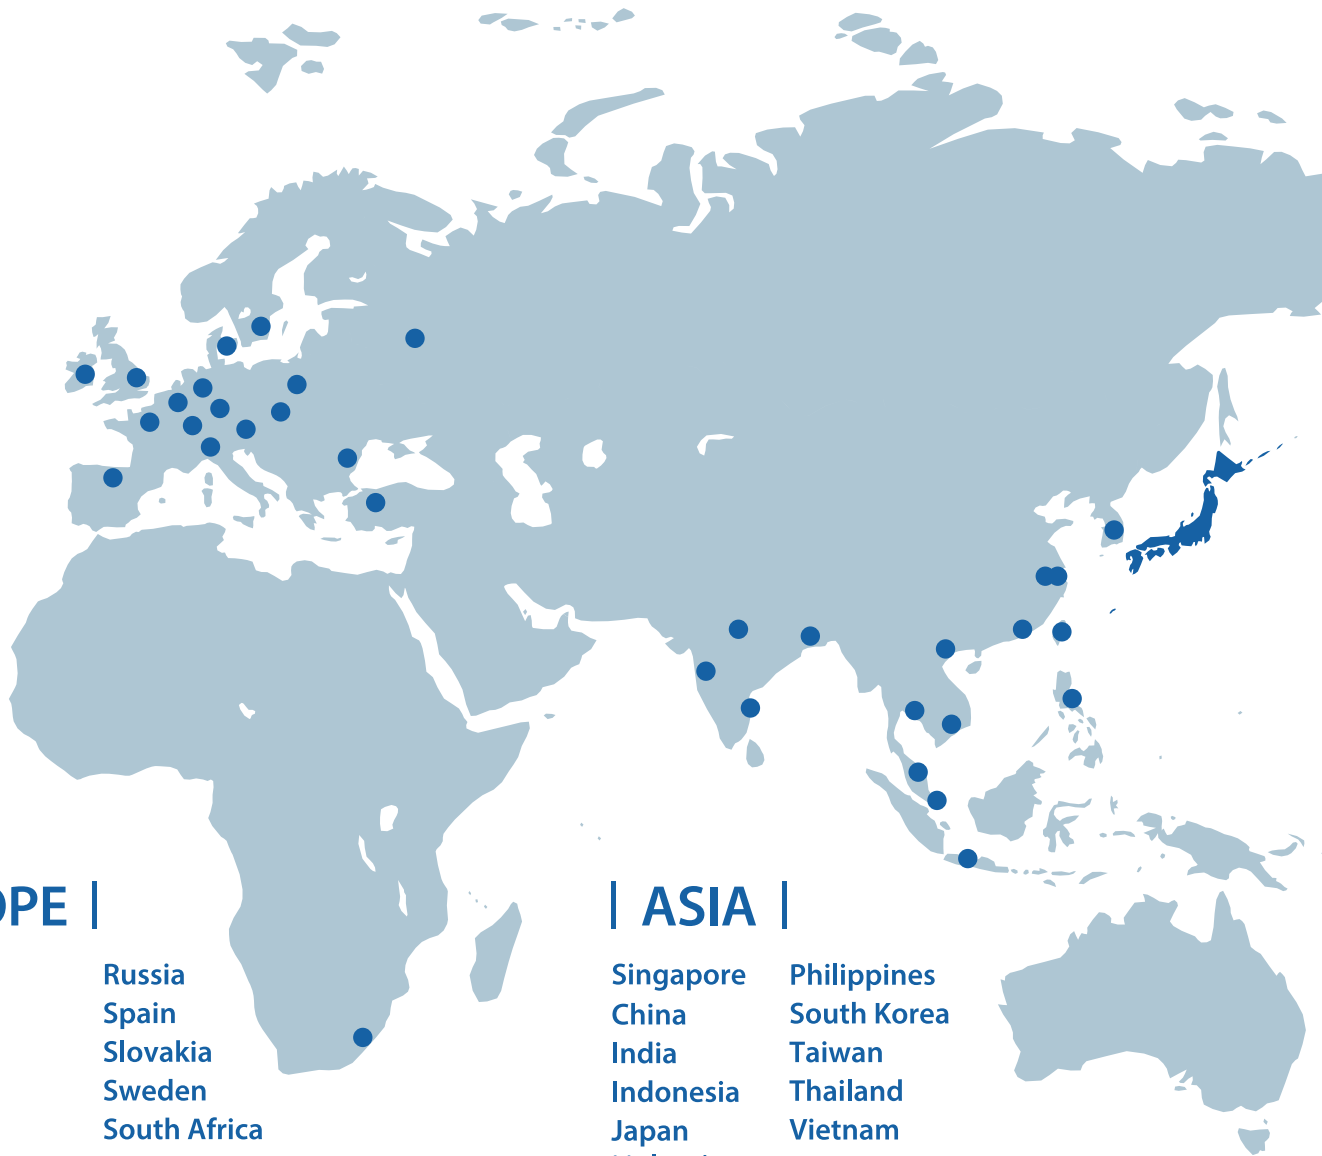

OSG USA, Inc. relocated it's National Headquarters to Irving, Texas

2018

OSG USA celebrates its 50th anniversary

Supporting Global Manufacturing with Top Class Products and Technology

OSG maintains absolute control over every aspect of its manufacturing capabilities. OSG products are produced in-house - from the production of tool material, creation of tool geometry, to the development of its own proprietary coatings - the 3 vital elements in the manufacturing of superior cutting tools.

Taps

From light production to high production, easy or difficult to machine materials, OSG has a tap for every application.

Drills

Be it Stub or X-long, coolant-thru or solid, carbide or HSS, OSG has a drilling solution for you.

End Mills

Whether it's Aluminum Alloy or Inconel, Hardened Steel or Stainless Steel, OSG has the end mill for your job.

Rolling Dies

OSG specializes in manufacturing superior quality dies and offers an extensive selection of both standard and special tooling to suit all of your external threading applications.

Indexable Tools

The latest technology in performance replaceable tip milling and drilling cutters from OSG.

Gauges

Ensure proper tolerances are met with OSG precision ground Plug Go and No Go gages.

Surface Treatments

OSG Product Treatments

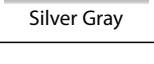

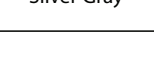

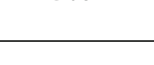

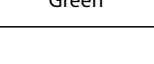

OSG's surface treatments are designed to meet customer needs through comprehensive technology by providing wear resistance, seizure resistance, corrosion resistance and mold release. OSG proprietary treatments provide a range of thicknesses, hardnesses and oxidation temperatures so you are sure to find the best match for any application.

Coating	Coating Color	Type	Thickness (µm)	Hardness (HV)	Oxidation Temp. (°C)	Application
IchAda	Black Gray	Cr	1~5	3100	1100	For drilling steel, stainless steel & hardened steel. A PVD coating with excellent surface smoothness and abrasion resistance, high surface hardness and heat resistance for small diameter tools.
DUARISE	Black Gray	Cr multilayer	1~5	3100	1100	For milling steel, stainless steel & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
DUROREY	Black Gray	SiC-containing Nano Layered Periodic	1~5	4180	1300	Ideally suited for Hardened steel > 50 HRC. Also works in: Cast Iron, Carbon Steel, Alloy Steel, Die Steel, Hardened Steel 35-50 HRC. Use in combination with High Speed Machining Techniques to optimize performance.
WD1	Iridescent Blue	Cr multilayer	3~5	3300	1100	For drilling steel, stainless steel, cast iron & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
EgiAs	Iridescent Red	Nano multilayer	3~5	3200	1100	For drilling steel, stainless steel, cast iron, aluminum & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
WXS	Black Gray	SiC	1~5	3500	1300	For drilling, tapping & milling steel, stainless steel & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
WXL	Black Gray	Cr	1~5	3100	1100	For drilling & milling steel, stainless steel & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
EXO[®]	Black Violet	TiAlN multilayer	3	2800	850	For drilling, tapping & milling steel, stainless steel, cast iron & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, very good heat resistance and low coefficient of friction to reduce material adhesion.
TiAlN	Black Violet	TiAlN	3	2800	800	For drilling, tapping & milling steel, stainless steel, cast iron & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, very good heat resistance and low coefficient of friction to reduce material adhesion.

Surface Treatments

Coating	Coating Color	Type	Thickness (µm)	Hardness (HV)	Oxidation Temp. (°C)	Application
 V	 Blue Gray	TiCN multilayer	3	2700	400	For drilling & tapping steel, stainless steel, aluminum & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, good heat resistance and low coefficient of friction to reduce material adhesion.
 TiCN	 Blue Gray	TiCN	3	2700	400	For drilling, tapping & milling steel, stainless steel, aluminum & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, good heat resistance and low coefficient of friction to reduce material adhesion.
 TiN	 Gold	TiN	3	2000	500	For drilling, tapping & milling steel, stainless steel, tool & die steel & aluminum. A PVD coating with good surface hardness and wear resistance, good heat resistance and low coefficient of friction to reduce material adhesion.
 SS	 Black Violet	TiAlN	1	2800	800	For drilling & tapping steel, stainless steel, & heat resistant alloys. A PVD coating with high wear & abrasion resistance, very good heat resistance and high surface smoothness to reduce material adhesion.
 HR	 Silver Gray	Ti	2	2800	700	For tapping stainless steel & heat resistant alloys. A PVD coating with high wear & abrasion resistance, very good heat resistance and high surface smoothness to reduce material adhesion.
 S/O	 Black	Steam-Oxide	-	-	-	For tapping steel, stainless steel, tool & die steel & nickel-alloys. The oxidized surface layer is porous and increases lubricity by retaining cutting fluid on the working area of the tool.
 Ni	 Silver Gray	Nitride	30~50	1000	-	For tapping cast iron, cast aluminum, & plastic. The case-hardened surface layer increases wear resistance in abrasive and tough materials.
 CrN	 Silver Gray	CrN	3	1800	700	For tapping non-ferrous materials. A PVD coating with high surface lubricity to reduce material adhesion applied over a case-hardened surface layer with increased wear resistance.
 DIA	 Black	DIA	20, 12	9000	600	For drilling, tapping & milling non-ferrous & composite materials. A CVD coating with superior surface hardness and wear resistance, outstanding durability, and excellent smoothness to reduce material adhesion.
 DG	 Black	DIA	20, 12	9000	600	For machining graphite and ceramics. A CVD coating with superior surface hardness and wear resistance, outstanding durability, and excellent edge sharpness.
 DLC	 Iridescent Green	DLC	0.2	6000	550	For milling non-ferrous materials. A PVD coating with excellent surface hardness and wear resistance, and very low coefficient of friction to reduce material adhesion.
 DLC+GUSS	 Iridescent Green	DLC (SP3 Rich)	0.8	6000	550	For milling non-ferrous materials. A thick-film PVD coating with excellent surface hardness and wear resistance for both high tool durability and good machining accuracy.
 BR	-	-	-	-	-	For general machining of all materials. The uncoated substrate provides good wear resistance and durability in general machining applications.

OSG Product Overview - The Total Solution

The purpose of this Brand Index is to illustrate OSG's Brand hierarchy and to better help you select the best tool for your machining needs.

From the value products under our OSG Standard brands to the high performance products under the EXOCARB®, EXOPRO® and our A Brand, OSG offers a broad range of tools to meet your application requirements.

The A Brand

A Brand

OSG's tooling master class of advanced performance tooling solutions for drilling, milling and threading applications. Elevate your manufacturing endeavors with unsurpassed performance for an extensive range of materials and applications. Quality, reliability, and satisfaction. Bring your A game with OSG's A Brand.

EXOPRO®

Ultra premium high performance carbide tooling with OSG's proprietary coatings for maximum productivity in specialized applications.

EXOCARB®

High performance carbide tooling with OSG's proprietary coatings for high-speed performance and high production applications in difficult to machine materials.

PHOENIX®

OSG's comprehensive line up of our PHOENIX® high-performance Indexable products are designed for rough and finish milling and drilling in a variety of applications.

EXO®

Premium high speed steel tooling with OSG's proprietary coatings for increased performance in a wide range of materials.

HY-PRO®

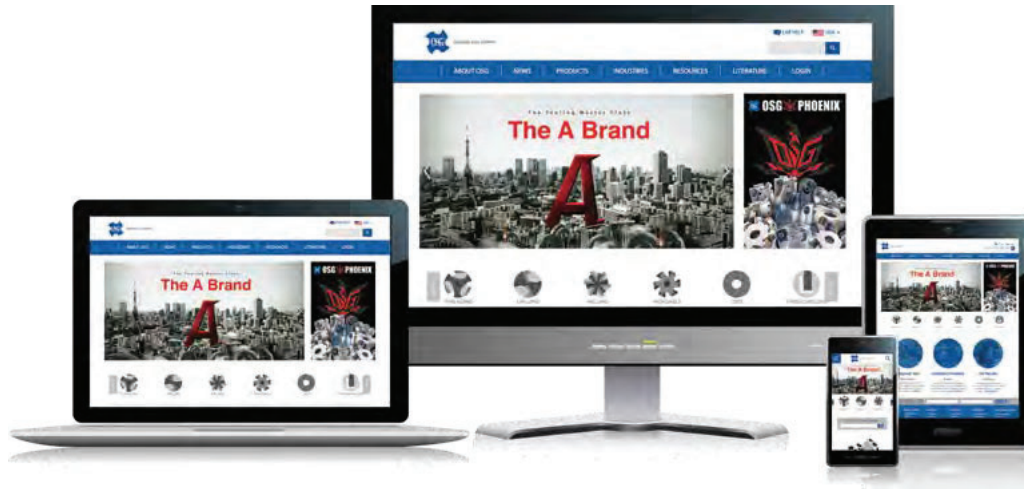

Performance tooling with OSG's propriety coatings to offer the ideal blend of performance and cost-efficiency.

OSG Online

osgtool.com

Our website, osgtool.com, is designed to help you find all your cutting tool solutions. We continuously strive to deliver a website that provides a value added experience by focusing on functionality, usability, and appearance while being responsive across all your devices.

The A Brand

The A Brand represents a new evolution in cutting tool technology. With a commitment to only the best, the A Brand emanates innovations essential for shaping the future of global manufacturing. The A Brand is not only a premium tooling brand, it also represents the quality assurance OSG guarantees to each and every customer. The A Brand is composed of OSG's latest high performance threading, drilling and milling tool innovations. Developed with attention to the finest details, manufacturers will experience the level of quality, reliability and satisfaction that can only be delivered by the A Brand tooling master class.

Advanced tool qualities have been incorporated into the A Brand products, including a versatility that enables a wide range of processing in different work materials, an excellent capability to perform difficult processing tasks, and high efficiency that leads to shortened production time and cost savings. Expectations have risen that the A Brand will bring innovations into the manufacturing field, and pass on OSG's technologies from today to the future. To better understand the concept of the A Brand, interviews were conducted with OSG experts who have devoted their manufacturing careers to the development of A Brand products. They spoke enthusiastically about how their passions underpinned the development process.

DRILLING

The A Brand

OSG's premium tooling brand. Features products that are designed to exceed the evolving manufacturing needs of our customers.

EXOPRO[®]

OSG's ultra-premium tooling series. Features supreme performance carbide drills with OSG's proprietary coatings, like EgiAs, WXS[®] and DIA, for maximum cost-efficiency.

EXOCARB[®]

High performance sub-micrograin carbide drills with OSG's proprietary EXO[®], WXS and SS coatings.

EXOCARB[®] MAX

Maximum performance carbide coolant-through drills for ultra high-speed drilling.

HY-PRO[®] CARB

Premium micrograin carbide drills with OSG EgiAs coating. Perfect blend of performance and cost-efficiency.

CARBIDE

Micrograin carbide drills and reamers.

VProducts

Premium powdered metal and cobalt high speed steel drills with OSG's proprietary V or WXL coating.

NEXUS

Premium high speed steel drills with OSG's proprietary WD1 coating.

EX-GOLD[®]

Premium high speed steel drills with TiN & TiAlN coating.

OSG **PHOENIX**[®]

OSG's high performance indexable tooling for drilling in a variety of applications.

● Stocked ○ Available Upon Request; MOQ May Apply ▲ Globally Stocked

Note: For drill diameter selection, use the method outlined below. Straight Fluted & Spiral Fluted Taps: 0.46 (TapØ) < (DrillØ) < 0.75 (TapØ). Spiral Pointed Taps: 0.6 (TapØ) < (DrillØ) < 0.75 (TapØ).

1. Broken Tap

Check how tap is broken. If any portion of the tap is protruding, grind the damaged surface of the tap flush with the workpiece. This will allow the damaged tap to be drilled easier.

2. Centering of Drill

Position the drill over the center of the tap. Please make sure both the workpiece and drill are properly secured. Make an initial light drill approach, and then quickly retract the drill. For this step, do not use lubrication.

3. Hole Processing

Drill the hole at a fixed feed and speed, stopping the operation occasionally to remove broken chips. In addition, use plenty of high quality cutting oil.

4. Chip Removal

Once the tap has been broken up, the remaining portions of the tap can be removed. For best results, use a scribe. Once the hole is cleaned, tapping can be resumed.

Cutting Conditions and Procedures to Note

1. Use a drilling speed of 65-80SFM.
2. Hand feed of 0.0005~0.001 in/rev is normal.
3. Use a rigid holder.
4. Select a high quality cutting oil and apply in sufficient amounts.
5. This tool should not be used to drill soft steels, aluminum alloys or other soft materials.
6. Resharpening should be done periodically.
7. For through hole processing of heat treated steels, use a spare piece of material underneath the material being drilled as this will prevent breakage caused by sudden torque.
8. **Cannot be used to remove forming taps.**

PXT

Mounting Procedure

Step 1	Step 2
 <p>Clean attachment area with an air nozzle. Any leftover cutting chips may prevent the head from being mounted properly and may cause damage to the tool.</p>	 <p>Manually attach the head.</p>
Step 3	Step 4
 <p>Insert the flat metal portion of the designated driver into the groove of the head. Insert the driver firmly into the groove. If the insertion of the designated driver is too shallow, it could damage the flutes.</p>	 <p>Turn the driver clockwise and mount the head onto the body. Mount it firmly and make sure that there is no gap in the area between the head and the body.</p>

● Stocked ○ Available Upon Request; MOQ May Apply ▲ Globally Stocked
Note: XC8035 recommended for peripheral cutting edge only.

⚠ Precautions when installing the insert

- The insert (XP8030) has a total of 4 working corners – 2 corners for the peripheral cutting edge and 2 corners for the center cutting edge.
- Use the peripheral cutting edge corner for the peripheral cutting edge and the center cutting edge corner for the center cutting edge.

Attached with peripheral cutting edge

Attached with center cutting edge

⚠ Precautions when installing the insert

- The insert (XP8030) has a total of 4 working corners – 2 corners for the peripheral cutting edge and 2 corners for the center cutting edge.
- Use the peripheral cutting edge corner for the peripheral cutting edge and the center cutting edge corner for the center cutting edge.

— Edges for peripheral cutting
— Edges for center cutting

Note:

- The indicated speeds and feeds are for drilling with **water-soluble oil** or **MQL**.
- Suitable cutting fluid is water-soluble high density oil (less than 20 times dilution).
- When using non-water-soluble oil or water-soluble oil (over 20 times dilution), reduce cutting speed by 30%.
- These conditions are for drilling depth under 8 times the drill diameter.
- 1D-2D step feeding may be required for drilling high hardened steels and mid-range (8D) work.

Note:

- The indicated speeds and feeds are for drilling with **water-soluble oil** or **MQL**. (We do not recommend mist drilling with stainless steels.)
- Water-soluble oil (20-30 times dilution) is recommended.
- When using non-water-soluble oil, set the cutting speed between 70-100% of the lowest limit.
- Make a pilot hole before deep drilling; recommended operation is on pages 310-311.
- A clogged oil hole can lead to breakage. Make sure that a filter is attached to the oil feeder.
- Peck drilling of 1D-2D is strongly recommended in high hardness materials.

Note:

- The indicated speeds and feeds are for drilling with **water-soluble oil** or **MLQ**. (We do not recommend mist drilling with stainless steels.)
- Water-soluble oil (20-30 times dilution) is recommended.
- When using non-water-soluble oil, set the cutting speed between 70-100% of the lowest limit.
- Make a pilot hole before deep drilling; recommended operation is on pages 310-311.
- A clogged oil hole can lead to breakage. Make sure that a filter is attached to the oil feeder.
- Peck drilling of 1D-2D is strongly recommended in high hardness materials.
- If, after piloting with ADO-5D and drilling with ADO-40D/50D, hole condition or accuracy is poor or machining is difficult, ADO-20D/30D may be used as an intermediate drilling step. This three-step process may improve accuracy and condition as well as permit more aggressive parameters than stated above.

Deep Hole Operational Guidelines

1. Make a pilot hole. (For 10-30D)

For a pilot hole, select 0.0008"-0.0031" (0.02-0.08mm) larger size drill than ADO 10D, ADO 15D, ADO 20D and ADO 30D. If the needed pilot drill size is not available, we recommend using the same diameter drill from ADO 3D.

1. Make a pilot hole. (For 40 & 50D)

For a pilot hole, select 0.0008"-0.0031" (0.02-0.08mm) larger size drill than ADO 40D and ADO 50D. If the needed pilot drill size is not available, we recommend using the same diameter drill from ADO 5D or ADO-TRS.

Remaining Steps are the Same for 10-50D

2. Insert the extra long drill into a pilot hole with zero or low revolution (below 500rpm).

3. Increase the revolution to the designated speed and start drilling.

4. After drilling, move the drill away from the bottom of the hole, then reduce its speed while pulling it out of the hole.

Make sure to use an internal coolant supply when drilling.

Drilling a Curved Surface

When working on a curved surface, we recommend piloting with A Brand ADF flat drill.

Improve Accuracy & Hole Condition

If, after piloting with ADO-5D and drilling with ADO-40D/50D, hole condition or accuracy is poor or machining is difficult, ADO-20D/30D may be used as an intermediate drilling step. This three-step process may improve accuracy and condition as well as permit more aggressive parameters.

Stable Drilling with Long Drills

The runout of a gripped cutting tool increases with the speed, as shown in the graph on the right. To ensure a higher level of work stability, OSG recommends making +0.0008"-0.0031" (+0.02-0.08mm) pilot holes and inserting long drills stopped or at low speeds.

The reason for this is made evident in the graph on the right. Increasing the speed increases the dynamic runout, posing a higher risk of the drill not fitting properly in the pilot hole. Therefore, reducing the speed and minimizing static runout is the recommended drilling method for long drills.

Static runout RPM (min ⁻¹)	0"	0.0003"	0.0007"	0.0015"
1,000	0.0001	0.0005	0.0009	0.0018
3,000	0.0005	0.0010	0.0014	0.0025
5,000	0.0012	0.0015	0.0019	0.0034

Dynamic runout values for Ø6mm 30xD drill.

Note:

1. This cutting condition chart is based on the usage of **water-soluble coolant and internal supply**.
2. Please use quality water-soluble coolant with a dilution factor of approximately 20 times, e.g. 5% concentration.
3. Please use a precision filter (rating of 3µm to 5µm) to prevent the oil holes from clogging.
4. Although the recommended coolant pressure is 3 MPa or more, please adjust accordingly if the level of flow volume is unsatisfactory due to the type and concentration of cutting fluid used.
5. For accurate mounting, acceptable deflection of the body cylindrical part at the shank end should be **less than 0.002µm**, as shown in the illustrated figure.
6. For work materials with poor chip evacuation, please perform step drilling as required.
7. Please always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.

- For accurate mounting, acceptable deflection of the body cylindrical part at the shank end should be **less than 0.002µm**, as shown in the illustrated figure.
- For work materials with poor chip evacuation, please perform step drilling as required.
- For holes deeper than 12D, please use a 2D type drill to prepare a pilot hole prior to processing.
- Please always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.

Deep Hold Drilling Procedures

ADO-MICRO 12D/20D/30D

1. Make a Pilot Hole with the ADO-MICRO 2D.

The ADO-MICRO 2D (140° point angle) is the recommended pilot hole drills of the ADO-MICRO 12D/20D/30D

When working on a curved surface, use the ADF (carbide flat drill) to counterbore a flat surface before drilling a pilot hole.

2. Insert the long drill into a pilot hole with a low revolution of 500 to 1,000 RPM.

3. Increase the revolution to the designated speed and start drilling.

4. After drilling, move the drill away from the bottom of the hole; then reduce its speed to 500 to 1,000 RPM while continuing to retract.

Note:

- The indicated speeds and feeds are for drilling with [water-soluble oil](#).
- Suitable cutting fluid is water-soluble high density oil (less than 20 times dilution).
- When using non-water-soluble oil or water-soluble oil (over 20 times dilution), reduce cutting speed by 30%.
- These conditions are for drilling depth under 3 times the drill diameter.
- For machines that cannot achieve the speeds indicated in the table please set rotation as high as possible. Tool life may be reduced.

Note:

- The table above assumes a milled-flat surface and water soluble coolant.
- Use a rigid and precise machine and holder.
- Please minimize overhang length as much as possible during machining.
- Adjust the rotational speed and feed in accordance with conditions such as the machining shape, machine rigidity, or work holding.
- Please set up the drill so that the runout of the cutting edge is under 0.0008".
- Please select a cutting fluid that is most suitable for the work material with minimal smoke formation.
- In the case of dry machining, please use air blow to remove chips to prevent clogging.
 - Please do not machine stainless steel dry.
- When machining an inclined plane, adjust the rotational speed and feed in accordance with the angle of the incline (β).
 - When the machining incline angle (β) is less than 30°, please reduce the feed to 40-60%.
 - When the machining incline angle (β) is over 30°, please reduce the speed to 60-80%, the feed to 20-40%.
- Please use step drilling when drilling in pre-drilled holes to improve chip separation.
- If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and feed as indicated above (in accordance with the machining precision requirement).
- Please always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.

Note:

- The speeds and feeds in the table above apply when drilling on a flat surface with water-soluble coolant.
- When using non-water soluble oil or water-emulsifiable (over 20 times dilution), reduce cutting speed by 30%.
- Use a rigid and precise machine and holder.
- Please minimize tool overhang as much as possible during machining.
- Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
- Please set up the drill so that the runout of the cutting edge is under 0.0004 in.
- When machining an inclined plane, adjust the rotational speed and the feed rate in accordance with the angle of the incline (β).
 - When the machining incline angle(β) is less than 30°, please reduce the feed to 40-60%.
 - When the machining incline angle(β) is over 30°, please reduce the speed to 60-80%, the feed to 40-60%.
- Please use step drilling in pilot holes to improve cutting chip separation.
- If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and the feed rate as indicated above (in accordance with the machining precision requirement).

Note:

- The speeds and feeds in the table above apply when drilling on a flat surface with water-soluble coolant.
- When using non-water soluble oil or water-emulsifiable (over 20 times dilution), reduce cutting speed by 30%.
- Use a rigid and precise machine and holder.
- Please minimize tool overhang as much as possible during machining.
- Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
- Please set up the drill so that the runout of the cutting edge is under 0.0004 in.
- When machining an inclined plane, adjust the rotational speed and the feed rate in accordance with the angle of the incline (β).
 - When the machining incline angle(β) is less than 30°, please reduce the feed to 40-60%.
 - When the machining incline angle(β) is over 30°, please reduce the speed to 60-80%, the feed to 40-60%.
- Please use step drilling in pilot holes to improve cutting chip separation.
- If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and the feed rate as indicated above (in accordance with the machining precision requirement).

1. The indicated speeds and feeds are for drilling with water soluble oil.
2. When using non-water soluble oil, reduce the drilling speed by 20%.
3. When centering on a curved or inclined surface, reduce the feed rate accordingly.
4. For machines that cannot achieve the speeds indicated in the table, please set rotation as high as possible.

1. Coolant is not needed, however, make sure dust is efficiently collected.
2. Peck drilling is not needed if drilling depth is less than 3D.
3. The machinability of CFRP depends on physical makeup and percentage of contents, both speed & feed may need adjustments depending on material.
4. Feed rate can be and should be adjusted depending on surface layer makeup.
5. Feed rates can be increased when an approved coolant is utilized.
6. Please contact OSG for specific application questions.

1/2	1,570	0.0020 - 0.0040	2,300	0.0120 - 0.0130

1. Feed rates can and should be adjusted depending on stack makeup, with higher feed rates in the composite portion and lower feeds in the metal portion.
2. Peck drilling may be necessary for enhanced quality and proper chip evacuation.
3. There are many factors that can effect successful stack drilling; please contact OSG about your specific application for best recommendation.

1. Use a water soluble oil with high density (5 to 10 times dilution).
2. Tight clamping is critical.
3. For drilling depth > 3D, use a step feed.
4. For materials susceptible to chip packing in the flute, apply a step feed.

List 5172 - EXOCARB® XH

Work Material	Broken Taps & Drills
Drilling Speed	65-80 SFM
Drill Dia. mm	Speed RPM
2	3,190 - 3,930
3	2,100 - 2,590
4	1,580 - 1,940
5	1,260 - 1,550
6	1,050 - 1,290
7	900 - 1,110
8	790 - 970
9	700 - 860
10	630 - 780
11	570 - 705
12	530 - 650

1. Use a drilling speed of 65-80 SFM.
2. Hand feed of 0.0005-0.001 in/rev is normal.
3. Use a rigid holder.
4. Select a high quality cutting oil and apply in sufficient amounts.
5. This tool should not be used to drill soft steels, aluminum alloys or other soft materials.
6. Resharpening should be done periodically.
7. For through hole processing of heat treated steels, use a spare piece of material underneath the material being drilled as this will prevent breakage caused by sudden torque.
8. Cannot be used to remove forming taps.

1. Please use in a machine with precise spindle rotation. Tight clamping is critical.
2. The indicated speeds and feeds are for drilling with water-soluble fluid.
3. Please use water-soluble high density fluid (less than 20 times dilution).
4. We recommend the pilot hole operation prior to EXOCARB® MAX-MINI (List 5310).
5. The run out with a drill in the spindle should be less than 0.0001".
6. OSG's Shrink Fit System is the recommended tool holder for these drills.

For machines that cannot achieve the speeds indicated in the above table, please set rotation as high as possible. Tool life may be decreased.

1. Please use in a machine with precise spindle rotation. Tight clamping is critical.
2. The indicated feeds and speeds are for drilling with water-soluble fluid.
3. Please use water-soluble high density fluid (less than 20 times dilution).
4. These tables are applicable for less than 3xD deep drilling operations.
When drilling deeper than 3xD, please peck every 0.25-0.5xD accordingly.
5. The run out with a drill in the spindle should be less than 0.0001".
6. OSG's Shrink Fit System is the recommended tool holder for these drills.

For machines that cannot achieve the speeds indicated in the above table, please set rotation as high as possible. Tool life may be decreased.

10	-	2,030	0.0055-0.0065	2,030	0.0055-0.0065	1,550	0.0055-0.0065	155	0.0035-0.0045
-	7/16	1,830	0.0060-0.0070	1,830	0.0060-0.0070	1,400	0.0060-0.0070	140	0.0035-0.0045
12	-	1,700	0.0065-0.0075	1,700	0.0065-0.0075	1,280	0.0065-0.0075	130	0.0040-0.0050
-	1/2	1,600	0.0065-0.0075	1,600	0.0065-0.0075	1,200	0.0065-0.0075	120	0.0040-0.0050

The chart above is for materials typically used in aircraft structures. Speeds may be less than optimal because of limitations in the portable machine tools utilized.

*When using our List 233 three flute drills we recommend the same RPM but feed rates should be increased by 25-35%.

Hole Depth Diameters	Reduce Spindle Speed	Reduce Feed Rate
3 x Dia.	10%	10%
4 x Dia.	20%	10%
5 x Dia.	30%	20%
6 x Dia.	35%	20%
8 x Dia.	40%	20%

When drilling deep holes, the recommended speeds and feeds should be reduced proportionately based on the hole depth. To the left are guidelines for reducing the speeds and feeds.

1. The indicated speeds and feeds are when water soluble oil is used.
2. Suitable cutting fluid is water-emulsifiable, high density oil (less than 20 times dilution).
3. When using non-water soluble oil or water-emulsifiable oil (over 20 times dilution), reduce drilling speed by 20%.
4. Pecking is necessary when drilling depth of the hole exceeds 3 times drill diameter for lathe/horizontal machines.

D: Drill Diameter

Drilling Depth	≤4D	≤5D	≤6D
Coefficient for reducing RPM	x0.9	x0.8	x0.75

1. The indicated speeds and feeds are when water soluble oil is used.
2. With the exception of using milling chucks, pay careful attention to ensure that drill is rigidly clamped and keep deflection at a minimum.
3. In case of drilling depth: >4D, reduce drilling speed as below.
4. When using non-water soluble oil or water-emulsifiable oil (over 10 times dilution), reduce drilling speed by 20%.
5. Step process should be used when drilling depth of the hole exceeds 4 times drill diameter for vertical machines or 3 times drill diameter for horizontal lathe machines.

1. Speeds and feeds are based on using soluble oil where applicable 1:5 to 1:10 concentration.
2. For deep holes (4 times the drill diameter or deeper) use the lower recommended feed rate as a starting point and increase as needed for the best result.
3. Recommended feeds and speeds are starting points only. Actual performance will be determined by specific material, the condition of equipment being used, and coolant.

1. The indicated speeds and feeds are for drilling with water soluble coolant.
2. The most suitable cutting fluid is water-emulsifiable high density oil (less than 10 times dilution)
3. When drilling cast surface (ie.not ground surface), reduce drilling speed by 20%.
4. For drilling depth>3D, reduce drilling speed (using the table below).
5. Step feeding is required for drilling depth>4D.
6. When using non-water soluble coolant or water-emulsifiable (over 10 times dilution), reduce the drilling speed by 20%.

D: Drill Diameter

Drilling Depth	≤4D	≤5D	≤6D
Coefficient for reducing RPM	x0.9	x0.8	x0.75

- Speeds and feeds are based on using soluble oil where applicable 1:5 to 1:10 concentration.
- When other than an end mill collet is used, make sure the drill shank is firmly attached.
- For deep holes (4 times the drill diameter or deeper) use the lower recommended feed rate as a starting point and increase as needed for the best result.
- Recommended feeds and speeds are starting points only. Actual performance will be determined by specific material, the condition of equipment being used, and coolant.

1. The indicated speeds and feeds are for drilling with water soluble oil.
2. When using non-water soluble oil, reduce the drilling speed by 20%.
3. When entering on a curved or inclined surface, reduce the feed rate accordingly.
4. When using a coated tool, the drilling speed can be increased by 1.2 times the value in the table.

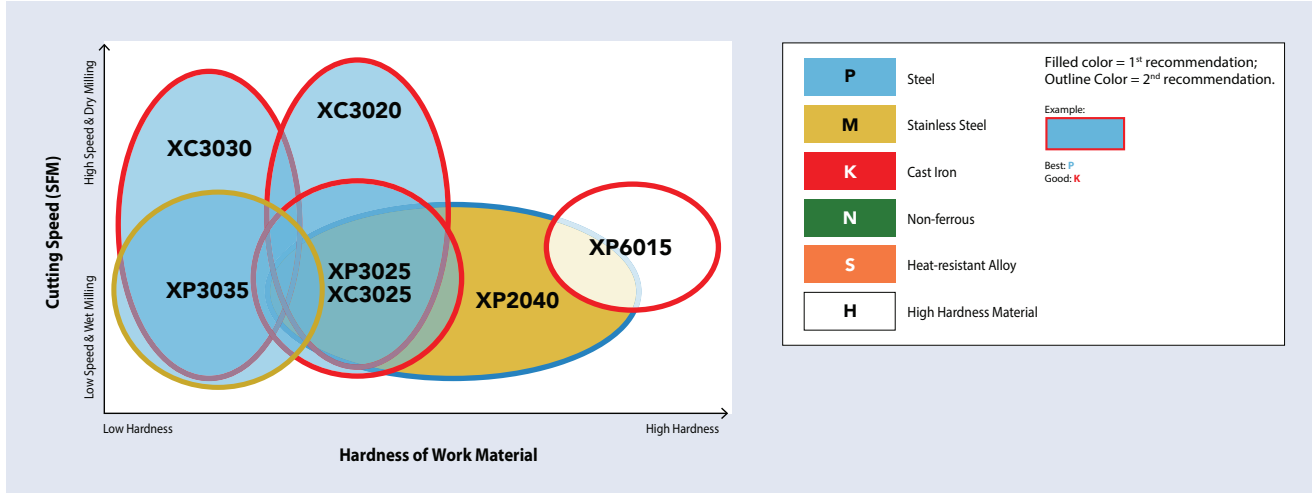

Type of Insert

Material Class	Grade	Coating Method	Hardness (HRA)	Surface Treatment		Features
				Main Component	Coating Thickness	
P	XP8030	PVD	91.9	TiAlN	3 μm	For machining steel and stainless steel Excellent balance of wear-resistance and chipping-resistance; can accommodate a wide range of workpiece materials.
	XC8035	CVD	89.6	TiCN + Al ₂ O ₃	7 μm	For machining steel and cast iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3425	PVD	91.8	Cr Composite multilayer	7 μm	For Drilling Steel Composed of a tough, high strength carbide material with a wear-resistant thick film coating.
	XC9015	CVD	91.9	TiCN + Al ₂ O ₃	7 μm	For Drilling Steel Composed of a tough carbide material with an anti-chipping and wear-resistant coating.
	XP9020	PVD	91.9	TiAlN	3 μm	For Drilling Steel, Stainless Steel, Cast Iron and Non-Ferrous Materials Composed of a tough carbide material with an anti-chipping and wear-resistant coating.
	XP9040	PVD	91.9	TiAlN	3 μm	For Drilling Steel and Stainless Steel Composed of a high-strength carbide material with an anti-chipping and wear-resistant coating.
M	XP2040	PVD	89.6	TiAlN	5 μm	For Machining Stainless Steel and Steel Ideal for general-purpose milling. Composed of a tough, high-strength carbide with an anti-chipping and wear-resistant coating.
K	XP1010	PVD	91.4	TiAlN	6 μm	For Drilling Cast Iron Composed of a tough, high-strength carbide material with highly rigid cutting edge and wear resistant coating.
	XP1425	PVD	91.8	Cr Composite multilayer	7 μm	For Drilling Cast Iron Composed of a tough, high strength carbide material with a wear-resistant thick film coating.
	XC9025	CVD	90.8	TiCN + Al ₂ O ₃	6 μm	For Drilling Cast Iron Composed of a tough, high-strength carbide with an anti-chipping and wear-resistant coating.
N	CK110	-	92.2	-	-	For Drilling Aluminum Alloy and Non-Ferrous Materials Composed of a non-coated carbide material with a sharp cutting edge and polished surface.
	CF225	-	91.8	-	-	For Drilling Non-Ferrous Materials Composed of a non-coated carbide material with an anti-chipping and wear-resistant properties.

Steel-based Work Material (Mild Steel, Steel, Hardened Steel)

Cast Iron & Ductile Iron

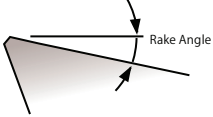

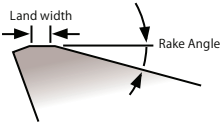

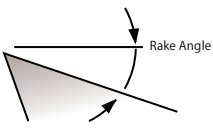

Stainless Steel

Type of Chip Breaker

Machining Method	Chip Breaker	Cutting Edge Cross-Section (Approximate)	Application
Holemaking	DM		For drilling various materials from steel to cast iron: a general purpose breaker with an ideal rake angle.
	DR		For drilling cast iron: a highly rigid breaker with an optimal land width and rake angle.
	DN		For drilling non-ferrous materials: a breaker with a sharp cutting edge and polish treatment for excellent chip evacuation.

Insert Designation

Z	D	K	T
①	②	③	④

Shape of Insert		
C	Diamond Apex 80°	
D	Diamond Apex 55°	
O	Octagon

1. For V slotting, use 80% of the Countersinking feed rate shown in the above table.

Standard Centering Depth (H)

When Point Angle (α) = 90°
Min. Centering Depth (H min) = 0.25mm
Min. Drill Hole Diameter (Dc min) = Ø2.5mm

$$H = (C - Dc \text{ min}) \div 2 + Hmin$$

H = Centering Depth (in mm)
 C = Countersink Diameter (in mm)

Ex: If Point Angle (α) = 90° and Countersink Diameter (C) = Ø10mm, Centering Depth (H) = 4mm

When Point Angle (α) = 120°
Min. Centering Depth (H min) = 0.1mm
Min. Drill Hole Diameter (Dc min) = Ø2.4mm

$$H = (C - Dc \text{ min}) \div 3.46 + Hmin$$

H = Centering Depth (in mm)
 C = Countersink Diameter (in mm)

Ex: If Point Angle (α) = 120° and Countersink Diameter (C) = Ø10mm, Centering Depth (H) = 2.3mm

Machining Tips

For Centering, Make the Centering Diameter Smaller than the Drill Diameter

Centering

Drilling

Countersinking

Inappropriate Center Diameter Relative to the Drill Diameter

Center remnants may occur at the bottom of the hole due to the shape of the insert, which may adversely affect the drilling process.

Bottom tip shape

Center remnants

Centering that Also Serves as Countersinking

When the centering diameter becomes larger than the drill diameter, the shoulder of the drill will collide with the workpiece, which may cause chipping on the cutting edge.

Drill Reconditioning

OSG Tool Reconditioning

OSG's Bensenville facility is the special cutting tool and regrinding authority based in the Chicago area. Through accurate and expedient regrinds of high-end cutting tools, OSG helps customers extend tool life and save money by restoring their used cutting tools to their original condition. In addition to regrinding, the Bensenville facility also manufactures custom drills, reamers, and other special cutting tools, performs product modifications and provides premium coating services.

As part of the OSG Corporation (headquartered in Japan), the regrind facility is the only OSG authorized regrinding source in America. The regrinding program uses the same OSG manufacturing drawings, adheres to OSG's strict quality control standards and uses the same equipment for OSG manufacturing and inspection procedures. As one of the world's leading cutting tool manufacturers, OSG offers a global network of support to our customers.

Tool Reconditioning Lowers Costs

The primary benefit of tool reconditioning is clear: the reduction in overall tooling costs. As part of normal production, tool wear, chipping and breakage occurs often affecting tool performance and increasing manufacturing costs. By reconditioning high performance drills, end mills and taps, OSG helps manufacturers realize substantial cost savings through extended tool life without jeopardizing production quality or performance. Because OSG's reconditioned tools are manufactured to the same high level of quality and held to the same exacting standards that new tools are, customers of OSG's tool reconditioning services can expect the same high performance and quality they are accustomed with OSG's new tools even after regrinding multiple times.

Engineering & Sales Support

OSG reconditions OSG tools using the same prints as the original tools made in our plants around the world. By using original part drawings, tools are accurately reconditioned to the original specifications, so customers are assured that reconditioned tools realize the same high level of performance. Manufacturers can also work directly with OSG design engineers to customize tools for enhanced performance or to meet specific requirements.

OSG's national sales team provides tooling expertise in the field for onsite evaluations and recommendations for manufacturers to implement a customized reconditioning program. The goal is to help manufacturers reduce tool costs and inventory, optimize performance and enhance overall profits.

Contact your OSG representative or distributor to review your tool reconditioning program.

CNC Training

OSG CNC technicians are extensively trained on proper setup methodologies and reconditioning processes by an on-staff CNC trainer. Through their development, the CNC Technician training program moves operators through three levels where they are diligently monitored and certified/reevaluated annually to maintain consistency and quality in our tools. Technicians are also trained and certified/reevaluated annually by Quality Assurance to perform inspections to print on first piece and in process tools.

Inspector Training

In order to guarantee that our tools are reconditioned to the highest standards, inspectors also undergo annual training and certifications which involve standardized procedures. These are the same methods that are used in the OSG manufacturing facilities in Japan and around the world. Inspectors are trained to inspect and measure tools completely to the original tool prints.

Throughout the reconditioning process, the tools are also continuously inspected until 100% visual inspection ensures that no chipped or defective tools are received by the customer. The high tech inspection equipment used at the reconditioning facility is the same equipment used at all OSG locations. This includes in-house

developed tool analyzers and state-of-the-art equipment with up to 300x magnification capabilities. The key to inspecting high performance, accurate reconditioned tools is assuring that they are held to the same inspection standards through the use of the same inspection methods as new OSG tools.

The Bensenville plant is subject to OSG's stringent JQA regrinding standards and is certified regularly by OSG Japan.

Equipment and Facility

In 2015, OSG opened a reconditioning facility which is equipped with state-of-the-art production and inspection equipment. The facility uses high precision 5-Axis CNC grinders throughout the reconditioning process for improved repeatability and precision.

OSG's weekly equipment Preventive Maintenance (PM) program ensures consistency and accuracy throughout the reconditioning process. Through this PM program, OSG's tool reconditioning performance will be consistent year after year.

THREADING

The A Brand

OSG's premium tooling brand. Features products that are designed to exceed the evolving manufacturing needs of our customers.

EXOPRO[®]

OSG's ultra-premium tooling series. Features supreme performance threading products with OSG's proprietary coatings for maximum cost-efficiency and productivity.

EXOCARB[®] Thread Mill

Premium sub-micrograin carbide thread mills suited for cast iron, steels, exotics and difficult-to-machine materials.

EXOCARB[®]

Ultra-high performance taps made from premium micrograin carbide used in automotive production, tapping hardened steels and threading the most abrasive of composite materials.

EXOTAP[®]

Ultra-premium taps made from VC-10 powdered metal high speed steel. EXOTAP[®] is the industry solution for difficult materials and applications, when no other tap seems to do the job.

HY-PRO[®]

Premium taps made from vanadium high speed steel and designed for a wide range of applications and industries.

HY-PRO[®] SEVEN

Semi-premium taps made from premium high speed steel for general purpose tapping applications.

GENERAL PURPOSE

Premium general purpose taps for general machining applications. Available in a variety of styles and coatings.

● Stocked ○ Available Upon Request; MOQ May Apply ▲ Globally Stocked

Note: Since it is made to measure class 2B, it can also be used as is for 3B. If the internal thread is a blind hole, please confirm that the internal thread length is longer than the screw length of DCT75. The selection of the Height Master is required if the nominal diameter of the internal thread has a chamfer or counterbore over 1.5mm. Please consult with your local sales representative.

Please be sure to purchase the DCT75 and the Height Master as a set.

Usage Guidelines:

1. Hold the sleeve against the entrance of the internal thread. Please confirm the position of the sleeve and ensure that it is not in the way.
2. After confirming the shape of the internal thread, the sleeve's outer diameter and the hole diameter, please confirm the shape of the internal thread's entrance where the sleeve is fitted against.
3. The digital unit uses the Digimatic Indicator manufactured by Mitutoyo, paired with programs exclusively made for the DCT75.
