Note: A Brand A-BSPP-RP is made to a ISO-7 R(p) standards - cylindrical female with internal threads rather than ISO 228, therefore the pitch diameter tolerance of ISO-7 extends lower than that of ISO 228 which can lead to tight or non-gaging fit. Please contact our customer service department should you require assistance.

Technical

Tap and Screw Thread Terminology

Allowance: The minimum clearance or maximum interference which is intended between mating parts.

Angle of Thread: The angle included between the flanks of a thread measured in an axial plane.

Back Taper: A slight taper on the threaded portion of the tap, making the pitch diameter near the shank smaller than that at the chamfer.

Basic: The theoretical or nominal standard size from which all variations are made.

Chamfer: The tapered and relieved cutting teeth at the front end of the threaded section. Common types of chamfer are taper (8 to 10 threads long), plug (3 to 5 threads), semi (or modified) bottom (2.5 to 3 threads), and bottoming (1-1/2 threads).

Crest: The top surface joining the two sides or flanks of a thread.

Cutting Face: The leading side of the land.

Flute: The longitudinal channels formed on a tap to create cutting edges on the thread profile.

Heel: The following side of the land.

Height of Thread: In profile, distance between crest and bottom section of thread measured to the axis.

Hook Face: A concave cutting face of the land. This may be varied for different materials and conditions.

Interrupted Thread: Alternate teeth are removed in the thread helix on a tap having an odd number of flutes.

Land: Threaded sections between the flutes of a tap.

Lead of Thread: The distance a screw thread advances axially in one turn.

Major Diameter: The largest diameter of the screw or nut on a straight screw thread.

Minor Diameter: The smallest diameter of the screw or nut on a straight screw thread.

Neck: The reduced diameter, on some taps, between the threaded portion and the shank.

Pitch: The distance from a point on one thread to a corresponding point on the next thread, measured parallel to the axis of rotation.

Pitch Diameter: On a straight screw thread, the diameter of an imaginary cylinder where the width of the thread and the width of the space between threads is equal.

Point Diameter: The diameter at the leading end of the chamfered portion.

Rake Angle: The angle of the cutting face of the land in relation to an axial plane intersecting the cutting face at the major diameter.

Relief: The removal of metal behind the cutting edge to provide clearance between the part being threaded and a portion of the threaded land. Also, see back taper.

Chamfer Relief: The gradual decrease in land height from cutting edge to heel on the chamfered portion of the tap land to provide radial clearance for the cutting edge.

Con-eccentric Relief: Radial relief in the thread form starting back of a concentric margin.

Eccentric Thread Relief: Radial relief in the thread form starting at the cutting edge and continuing to the heel.

Root: The bottom surface joining the flanks of two adjacent threads.

Side or Flank Thread: The surface of the thread which connects the crest to the root.

Shank: The portion of the tap by which it is held.

Spiral Point: An oblique cutting edge ground into the lands to provide a shear cutting action on the first few threads.

Square: The squared end of the tap shank by which the tap is driven.

Thread: The helical formed portion of the tap which produces the pitch in a pre-existing hole.

Thread Lead Angle: The angle made by the helix of the thread at the pitch diameter, with a plane perpendicular to the axis.

Threads per Inch: The number of threads in one inch of length.

Thread:

Single: A thread in which lead is equal to pitch.

Double: A thread in which lead is equal to twice the pitch.

Triple: A thread in which lead is equal to triple the pitch.

Formulas

SFM (Surface Feet per Minute) = 0.262 x RPM x D

RPM (Revolutions Per Minute) = (3.82 x SFM) / D

Note: D = Diameter (Must be in inches)

*Major diameter for H7 Limit Taps is 0.002" larger than values shown in min. and max. columns.

LEAD TOLERANCE

A maximum lead deviation of plus or minus 0.0005" within any two threads not farther apart than one inch is permitted.

ANGLE TOLERANCE

6 to 9 threads per inch incl. = ±25' in 1/2 angle. 10 to 80 threads per inch incl. = ±30' in 1/2 angle.

FORMULA

Maximum major diameter = Basic + A.
Minimum major diameter = Basic + B.
For values of A and B see table 331.

PITCH DIAMETER LIMITS FOR TAPS THROUGH 1" DIAMETER

H1 Limit = Basic PD to basic PD + 0.0005".
H2 Limit = Basic PD + 0.0005" to Basic PD + 0.0010".
H3 Limit = Basic PD + 0.0010" to Basic PD + 0.0015".
H4 Limit = Basic PD + 0.0015" to Basic PD + 0.0020".
H5 Limit = Basic PD + 0.0020" to Basic PD + 0.0025".
H6 Limit = Basic PD + 0.0025" to Basic PD + 0.0030".

PITCH DIAMETER LIMITS FOR TAPS OVER 1" DIAMETER THROUGH 1-1/2" DIAMETER

H4 Limit = Basic PD + 0.0010" to Basic PD + 0.0020".

Ground Thread Taps (USCTI Table 331)

The following tables and formula are used in determining the limits and tolerances for ground thread taps having a thread lead angle not in excess of 5-degrees, inless otherwise specified.

LEAD TOLERANCE

A maximum lead deviation of $\pm 0.0005''$, within any two threads not farther apart than 1" is permitted.

ANGLE TOLERANCE

Threads Per Inch	Deviation in Half Angle
4 to 5-1/2 incl.	$\pm 20'$
6 to 9 incl.	$\pm 25'$
10 to 80 incl.	$\pm 30'$

FORMULA

Max. Major Dia. = Basic + A
 Min. Major Dia. = Basic + B
 In the above formula:
 A = Constant to add = 0.130P for all Pitches
 B = Major Diameter Tolerance = 0.087P for 48 Through 80 TPI
 = 0.076P for 36 Through 47 TPI
 = 0.065P for 4 Through 35 TPI
 C = Amount over basic for minimum pitch diameter
 D = Pitch diameter tolerance

Note: When the tap major diameter must be determined from a specified tap pitch diameter, the maximum major diameter equals the minimum specified pitch diameter minus Constant C, plus 0.64952P, plus Constant A.

LEAD TOLERANCE

A maximum lead deviation of ± 0.013 mm within any two threads not farther apart than 25 mm is permitted.

ANGLE TOLERANCE

Pitch (mm)	Deviation in Half Angle
Over 0.25 to 2.5 Incl.	$\pm 30'$
Over 2.5 to 4 Incl.	$\pm 25'$
Over 4 to 6 Incl.	$\pm 20''$

FORMULA

Min. Major Dia. = Basic + W	Max. Pitch Dia. = Basic + Y
Max. Major Dia. = Min. + X	Min. Pitch Dia. = Max. - Z
For Values of W, Y & Z, See Table 341	

In all cases, the tap major and pitch diameter inch conversions have been rounded upwards to the next ten thousandth of an inch. Basic values agree with B1 Report—ISO Metric Screw Threads, Table 9B.

OH Tap Limits

OH Limits for Taps with a pitch ≤ 0.6

OH Limits for Taps with a pitch ≥ 0.7

Ground Thread Tap Limits (USCTI Table 341)

The following tables and formula are used in determining the limits and tolerances for ground thread metric taps unless otherwise specified. They apply only to metric threads having a 60° form with a P/8 flat at the major diameter of the basic thread form.

LEAD TOLERANCE

A maximum lead deviation of ±0.013 mm within any two threads not farther apart than 25 mm is permitted.

ANGLE TOLERANCE

Pitch (mm)	Deviation in Half Angle
Over 0.25 to 2.5 incl.	±30'
Over 2.5 to 4. incl.	±25'
Over 4 to 6 incl.	±20'

FORMULA

Min. Major Dia = Basic + W	Max. Pitch Dia. = Basic + Y
Max. Major Dia. = Min. + X	Min. Pitch Dia. = Max. - Z

W = Constant to add to Basic Major Diameter*

X = Major Diameter Tolerance

Y = Amount over Basic for Maximum Pitch Diameter

Z = Pitch Diameter Tolerance

*W = .080P Converted to inches

Note: When the tap major diameter must be determined from a specified tap pitch diameter, the minimum major diameter equals the maximum specified tap pitch diameter minus constant Y, plus the basic single height of thread, plus constant W.

Pitch		Symmetrical Thread Height	Tap Limits for Metric Threads (inch)										
			W	X	Y				Z				
					M1.6 To M6.3 Incl.	Over M6.3 to M25 Incl.	Over M25 To M90 Incl.	Over M90	M1.6 To M6.3 Incl.	Over M6.3 to M25 Incl.	Over M25 To M90 Incl.	Over M90

For intermediate pitches use value for next coarser pitch.

Symmetrical Thread Height; Equivalent to the basic height, h, of the original American National Form.

ISO Tolerance System

The ISO Metric Screw Thread Tolerance System provides for tolerance grades and tolerance positions (allowances) for the pitch diameter and crest diameter.

Tolerance Grades

A series of numbers, 3 through 9, were established as symbols, to reflect the size of the tolerance; the higher the number the larger the tolerance.

FOR EXTERNAL THREADS - (LOWER CASE LETTER SYMBOLS)

- Tolerance Position “e” has a large allowance. The upper limit is below basic by a large amount.
- Tolerance Position “g” has a small allowance. The upper limit is below basic by a small amount.
- Tolerance Position “h” has no allowance and the upper limit is basic.

FOR INTERNAL THREADS - (CAPITAL LETTER SYMBOLS)

- Tolerance Position “G” has a small allowance. The lower limit is above basic by a small amount.
- Tolerance Position “H” has no allowance and the lower limit is basic.

Selection of Tolerance Classes

Two factors determine the selection of a suitable tolerance class:

1. Length of thread engagement (short, normal or long)
2. Quality requirement (fine, medium or coarse) See table below for preferred tolerance classes.

Tolerance Positions

They define the maximum-material limits of the pitch and crest diameters and indicate their relationship to the basic profile. For plating requirements and ease of assembly, a series of tolerance positions were established.

Preferred Tolerance Classes

Quality Requirement	External Thread (Bolts)									Internal Thread (Nuts)					
	Tolerance Position e (Large Allowance)			Tolerance Position g (Small Allowance)			Tolerance Position h (No Allowance)			Tolerance Position G (Small Allowance)			Tolerance Position H (No Allowance)		
	Length of Thread Engagement			Length of Thread Engagement			Length of Thread Engagement			Length of Thread Engagement			Length of Thread Engagement		
	Short	Normal	Long	Short	Normal	Long	Short	Normal	Long	Short	Normal	Long	Short	Normal	Long
FINE (Close Fit Applications)							3h-4h	4h	5h-4h				4H		
MEDIUM (General Purpose Applications)		6e	7e-6e	5g-6g	6g	7g-6g	5h-6h	6h	7h-6h	5G	6G	7G	5H		
COARSE (Difficult Manufacturing Applications)					8g	9g-8g					7G	8G			

Tolerance Position “e” is not to be applied to pitches finer than 0.5 mm. Tolerance classes 6g and 6H are for commercial screw, bolt and nut threads.

Thread Designations

Basic Designations: The letter “M” and the nominal size (basic major diameter in millimeters) followed by “X” and the pitch in millimeters, designates metric screw threads. For coarse series thread, the “X” and pitch may be omitted.

Example: Coarse series threads; M6 other threads; M8 x 1

A complete designation comprises, in addition to the basic designation, the tolerance class symbol separated by a dash. When the pitch and crest diameter tolerance classes are identical, the symbol need only be given once.

Example: M20 x 2—6H

When the pitch and crest diameters have different tolerance classes, the pitch diameter symbol is followed by the crest diameter symbol.

Example: M6 x 0.75—5g—6g

To indicate a specified thread fit between mating parts, the internal thread tolerance class symbol is followed by that of the external thread, separated by a slash.

Example: M20 x 2—6H/5g—6g

When rounded root external threads are to be specified, the minimum root radius value shall be added to the tolerance class designation.

Example: M6—5g —6g 0.100R

Limiting Dimensions of Standard Series Threads for Commercial Screws, Bolts and Nuts (Inches)

Nominal Size Diam	Pitch P	Basic Thread Designation	External Thread (Bolt)									Internal Thread (Nut)						
			Tol Cl.	Allowance	Major Diameter		Pitch Diameter			Minor Diameter		Tol Cl.	Minor Diameter		Pitch Diameter			Major Dia.

Excerpt from American National Standard B1. 16-1972, American Gaging Practices for Metric Screw Threads; "In all cases the inch conversion values have been rounded toward the interior of the tolerance zone, that is, maximum limits have been rounded downward and minimum limits have been rounded upward. Due to the fact that the majority of machinery and measuring equipment in the United States is based on the inch system, all gages should be made to the inch conversions."

TAP RECOMMENDATIONS: The pitch diameter high limits of the recommended tap for 6H tolerance class is 40% of the product tolerance rounded to the nearest 0.0005."

Example: M10 x 1.5; product tolerance = 0.00070" x .40 = .0028" rounded to 0.0030". This is the amount over basic pitch diameter. Based on 0.0005" increments over basic pitch diameter, the recommended tap has a D6 high limit (0.0030 ÷ 0.0005").

General Dimensions (USCTI Table 311)

Nominal Size (Inch)	Dimensions (Inch)				
	Overall Length A	Thread Length B	Length of Square C	Shank Diameter D	Size of Square E

8	Major Dia.	0.0048	0.0090	0.0080	0.0103
	Minor Dia.		0.0090		0.0080

Minimum minor diameter flats are not specified. May be as sharp as practicable. Ground Thread Taps marked NPT may be used for NPT and ANPT applications.

LEAD TOLERANCE

A maximum lead deviation of ±.0005" within any two threads not farther apart than one inch is permitted.

FORMULA FOR AMERICAN NATIONAL STANDARD PIPE FORM

Minimum major diameter = Measured pitch diameter +A.
 Maximum major diameter = Measured pitch diameter +B.
 Minimum minor diameter = Measured pitch diameter -B.
 Maximum minor diameter = Measured pitch diameter -C.

FORMULA FOR DRYSEAL AMERICAN NATIONAL STANDARD PIPE FORM

Minimum major diameter = Measured pitch diameter +D.
 Maximum major diameter = Measured pitch diameter +E.
 Minimum minor diameter = Maximum or smaller.
 Maximum minor diameter = Measured pitch diameter -E.

LEAD TOLERANCE

A maximum lead deviation of plus or minus 0.0005" within any two threads not farther apart than one inch is permitted.

Note: Taps made to these specifications are marked NPS and used for NPS, NPSC, and NPSM.

Angle Tolerance

Threads Per Inch	Deviation in Half Angle
8	± 25'
11 1/2 to 27 Incl.	± 30'

Formula for American National Standard Dryseal Pipe Form (NPS)

The maximum Pitch Diameter of tap is based upon an allowance deducted from the maximum product pitch diameter of NPSC or NPSM, whichever is smaller. The minimum Pitch Diameter of tap is derived by subtracting the ground thread pitch diameter tolerance for actual equivalent size as shown in Table 331, page 771, Col. D.

Nominal Size (inch)	Major Diameter		Minor Diameter

The limits specified above are intended to serve as a guide for establishing limits for the thread elements of taps, dies, and thread chasers. These limits may be required on the product. For complete specifications see latest edition of USE Standard B2.1. The Military Aeronautical Specification MIL-P-7105 agrees with all values given in this table.

Dryseal American National Standard Pipe Threads

Crest and root limits for Dryseal American National Standard External and Internal Pipe Threads (NPTF)

The major diameter of standard taper pipe plug gages and the minor diameter of standard taper pipe ring gages used for gaging dryseal threads will be truncated .20p minimum to .25p maximum for all pitches.

Tap Drill Sizes - Cut Taps - Inch

To minimize tapping problems and lengthen tool life, use the largest drill possible to produce a minor diameter that will result in the lowest percentage of full thread consistent with adequate strength. A minor diameter that provides a 55% to 65% thread is sufficient for most requirements, but in some cases a higher percentage of thread may be necessary to conform with the minor diameter limits of the thread class specified.

* Generally, deeper than 1-1/2 times the hole diameter.

Suggested Percentage of Full Thread in Tapped Holes

Material		*Deep Hole Tapping	Average Commercial Work	Thin Sheet Stock or Stamping
Free Cutting	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Hard or Tough Cutting	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%

FORMULA: TAP DRILL SIZE	FORMULA: PERCENTAGE OF FULL THREAD
$\text{Drill Size} = \text{Tap Major Dia} - \frac{0.01299 \times \% \text{ of Full Thread}}{\# \text{ of Threads Per Inch}}$	$\% \text{ of Full Thread} = \text{Threads Per Inch} \times \frac{\text{Tap Major Dia} - \text{Drill Dia}}{0.01299}$
Example: to determine drill size for 1/4"-20 UNC tap, 70% thread Tap Major $\phi = 0.2500"$ % of Full Thread = 70% # of Threads per Inch = 20	Example: to determine the % of thread for 1/4"-20 UNC using 0.2045" drill # Threads per Inch = 20 Tap Major $\phi = 0.2500"$ Drill $\phi = 0.2045"$
$\text{Drill Size} = 0.2500" - \frac{(0.01299 \times 70\%)}{20}$ $\text{Drill Size} = 0.2500" - 0.0455" = 0.2045"$	$\% \text{ of Thread} = 20 \times \frac{(0.2500 - 0.2045)}{0.01299}$ $\% \text{ of Thread} = 20 \times 3.50 = 70\%$

Tap Drill Sizes - Cut Taps - Metric

To minimize tapping problems and lengthen tool life, use the largest drill possible to produce a minor diameter that will result in the lowest percentage of full thread consistent with adequate strength. A minor diameter that provides a 55% to 65% thread is sufficient for most requirements, but in some cases a higher percentage of thread may be necessary to conform with the minor diameter limits of the thread class specified.

* Generally, deeper than 1 1/2 times the hole diameter.

Suggested Percentage of Full Thread in Tapped Holes

Material		*Deep Hole Tapping	Average Commercial Work	Thin Sheet Stock or Stamping
Free Cutting	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Hard or Tough Cutting	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%

FORMULA: TAP DRILL SIZE		FORMULA: PERCENTAGE OF FULL THREAD	
$\text{Drill Size} = \text{Tap Major Dia.} - \frac{\text{Pitch} \times \% \text{ of Full Thread}}{76.980}$		$\% \text{ of Full Thread} = \text{Threads Per Inch} \times \frac{76.980}{\text{Pitch}}$	
Example: to determine drill size for M12 x 1.75 tap, 70% thread Tap Major $\varnothing = 12\text{mm}$ % of Full Thread = 70% Pitch = 1.75mm		Example: to determine the % of thread for M12 x 1.75 Tap using 10.41mm drill # Threads per Inch = 20 Tap Major $\varnothing = 0.2500"$ Drill $\varnothing = 0.2045"$	
$\text{Drill Size} = 12\text{mm} - \frac{(1.75 \times 70\%)}{76.980}$		$\% \text{ of Thread} = (12\text{mm} - 10.409\text{mm}) \times \frac{(0.2500 - 0.2262)}{0.0068}$	
$\text{Drill Size} = 12\text{mm} - 1.591\text{mm} = 10.409\text{mm}$		$\% \text{ of Thread} = 1.591\text{mm} \times 43.989 = 70\%$	

Tap Drill Sizes - Form Taps - Inch

To minimize tapping problems and lengthen tool life, use the largest drill possible to produce a minor diameter that will result in the lowest percentage of full thread consistent with adequate strength. A minor diameter that provides a 55% to 65% thread is sufficient for most requirements, but in some cases a higher percentage of thread may be necessary to conform with the minor diameter limits of the thread class specified.

* Generally, deeper than 1 1/2 times the hole diameter.

Suggested Percentage of Full Thread in Tapped Holes

Material		*Deep Hole Tapping	Average Commercial Work	Thin Sheet Stock or Stamping
Free Cutting	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Hard or Tough Cutting	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%

The suggested drill sizes for aluminum listed in the table are within the minor diameter limits for STI tapped holes specified in MS 33537. Alternate drill sizes are suggested in many instances for magnesium, steel and plastics to provide for maximum tap wear life. In the case of magnesium, the larger size is recommended to allow for material close-in. There are suggested drill sizes and any special requirements or specifications will supersede these recommendations.

Tap Drill Sizes - STI Taps - Metric

The suggested drill sizes for aluminum listed in the table are within the minor diameter limits for STI tapped holes specified in MS 33537. Alternate drill sizes are suggested in many instances for magnesium, steel and plastics to provide for maximum tap wear life. In the case of magnesium, the larger size is recommended to allow for material close-in. There are suggested drill sizes and any special requirements or specifications will supersede these recommendations.

Machining Technique

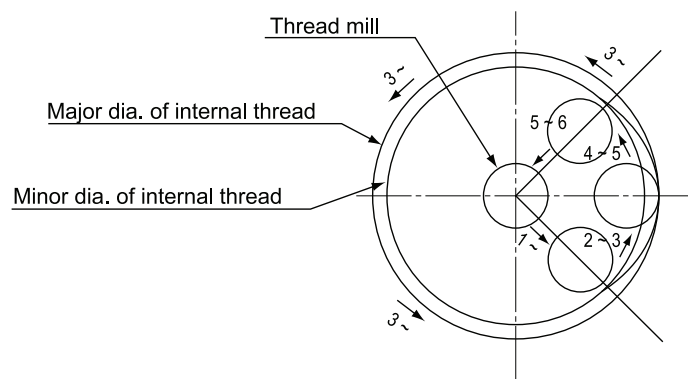

OSG's A Brand & EXOCARB® Thread Mills have been developed for thread milling on a 3-Axis CNC controlled machine tool. Threads are produced by advancing one pitch feed per revolution in the axial direction, utilizing the planet-like rotation and revolution movements of the tool. Internal and right/left hand threads can all be produced with this one tool by simply changing the direction of feed.

Threading Process

- 1-2 Move to edge (maintain clearance)
- 2-3 Cut with helical milling
- 3-4 Mill the circumference of the circle
- 4-5 Pull away from the edge
- 5-6 Remove tool

The transition between the start and finish of the milling operation must be smooth, and the appropriate amount of feed is essential for minimizing milling resistance. There are many different methods for using this tool, but our research has shown that this technique provides the most precise and efficient operation.

Thread Milling Process (view from above)

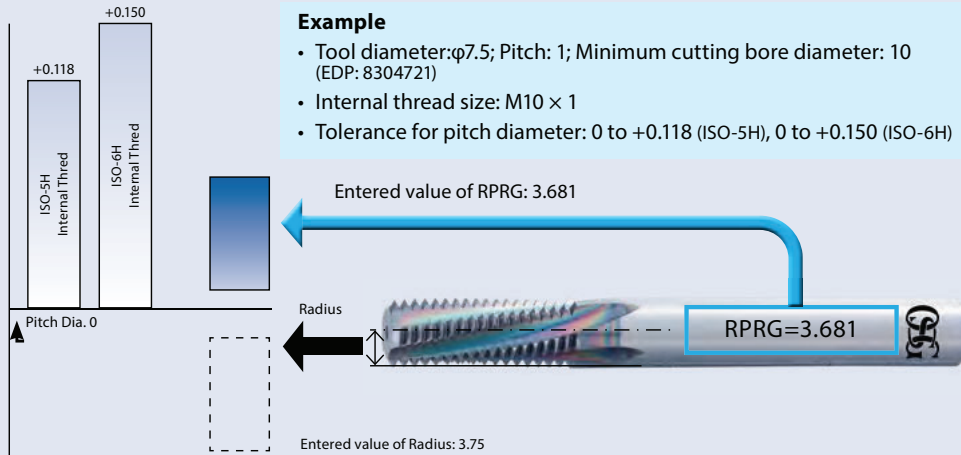

Radius Offset (RPRG)

RPRG is the reference value of tool radius offset.

Conventionally, the tool radius was entered during setup as a parameter of the NC system, which was corrected by checking the thread with a gauge. However, it has become possible to reduce the checking and correction simply by entering the RPRG value indicated on the tool shank.

NOTES:

1. RPRG are reference values. Determine optimal values after trial cutting as values depend on machining environment.
2. RPRG values are optimally established to achieve ISO:5H (formerly Grade 1) internal thread limits for metric threads and ANSI:3B internal thread limits for unified threads. RPRG values established for taper pipes (R/Rc) are effective when using the thread milling NC code generator software ThreadPro available on our website.
3. For diameters of thread mills, RPRG values are calculated based on the minimum cutting bore diameter (the minimum cutting internal thread size of the tool diameter). To cut other diameters, it is necessary to use a smaller value than RPRG.

ThreadPro (Thread Milling NC Code Generator Software)

www.osgtool.com/threadpro

- Available in 12 different languages
- Supports 8 NC programming languages
- Incorporates RPRG* value to further simplify process

* RPRG = reference value of tool radius offset

1. The indicated speeds and feeds are for water-soluble coolant.
2. Water-soluble coolant is not suitable for threading magnesium alloy.
3. Please adjust the cutting conditions depending on the rigidity of the machine, tool holders, and workpiece clamping.
4. If the threading length is long, or when machining a large-pitch thread, reduce the feed rate and take multiple passes.
5. If a machined parallel internal thread is tapered and prevents the go-gauge from going through, add a zero cut/spring pass.

- The tool is left-hand cutting - program the spindle for counterclockwise rotation.**
 - The indicated speeds and feeds are for air blow cooling.
 - Please use water soluble coolant when machining aluminum materials.
 - When machining magnesium please refer to the coolant oil manufacturer's specification for recommended oil. Please also properly dispose of the cutting chips to prevent fire hazards.
 - Please adjust the cutting conditions depending on the rigidity of the machine, tool holder, and workpiece clamping.
 - Tool vibration should be kept at a minimum level to ensure highest thread accuracy.
 - Select a higher feed rate for larger diameter tooling and a lower feed rate for smaller diameters.
- *Titanium and Nickel alloy parameters are only to be used for tools with internal coolant running water soluble coolant.

1. This cutting condition table shows the standard values. When machining, it is recommended to use the program created by the NC program creation tool "ThreadPro".
2. Please select "Continuous" as the path type of ThreadPro.
3. Please use water soluble coolant unless there is pre-hole made by casting or drilling.
4. When machining magnesium please refer to the coolant oil manufacturer's specification for recommended oil. Please also properly dispose of the cutting chips to prevent fire hazards.
5. Please adjust the cutting conditions depending on the rigidity of the machine, tool holder, and workpiece clamping.
6. Tool vibration should be kept at a minimum level to ensure highest thread accuracy.
7. Select a higher feed rate for larger diameter tooling and a lower feed rate for smaller diameters.
8. The tool is left-hand cutting - program the spindle for counterclockwise rotation.

Note

Bottom shape of finished hole is as depicted in the right picture. Please make sure that it is acceptable based on the cutting instruction in advance.

List 42000/42001 - EXOCARB® Thread Mill NPT/NPTF

Work Material	SFM	Feed Rate (Inch/Tooth)	No. of Passes
Low Carbon Steel	300 - 420	0.0016 - 0.0050	1
Medium Carbon Steel	300 - 420	0.0016 - 0.0050	1
High Carbon Steel	250 - 420	0.0016 - 0.0050	1
Alloy Steel	180 - 350	0.0008 - 0.0040	1-2
Heat Treated Steel (28-34HRC)	160 - 300	0.0008 - 0.0040	1
Heat Treated Steel (34-40HRC)	130 - 260	0.0004 - 0.0040	1-2
Heat Treated Steel (40-50HRC)	65 - 250	0.0004 - 0.0040	2-4
Stainless Steel (300 - Series)	200 - 450	0.0016 - 0.0060	1-2
Stainless Steel (400 - Series)	165 - 400	0.0016 - 0.0060	1-2
Stainless Steel (15-5, 17-4PH)	130 - 350	0.0016 - 0.0060	2
Cast Iron	250 - 400	0.0008 - 0.0035	1
Ductile Cast Iron	210 - 280	0.0012 - 0.0040	1
Aluminum Alloy	300 - 500	0.0012 - 0.0040	1
Aluminum Alloy Casting Si [12]%	280 - 550	0.0012 - 0.0050	1
Aluminum Alloy Casting Si [12-16]%	250 - 460	0.0012 - 0.0040	1
Aluminum Alloy Casting with Si [16-20]%	210 - 400	0.0012 - 0.0040	1
Aluminum Alloy Casting with Si [20-25]%	200 - 350	0.0012 - 0.0040	1
Copper, Copper Casting	300 - 510	0.0012 - 0.0040	1
Brass, Brass Casting	300 - 510	0.0012 - 0.0040	1
Bronze, Bronze Casting (C6***,PB,PBC)	300 - 500	0.0012 - 0.0040	1
Magnesium Alloy Casting	210 - 410	0.0012 - 0.0050	1
Zinc Alloy Casting	180 - 380	0.0012 - 0.0050	1
Titanium Alloy (Ti-6Al-4V)	100 - 330	0.0012 - 0.0025	2
High Heat Resistance Alloy (Inconel)	65 - 260	0.0008 - 0.0020	2
High Heat Resistance Alloy (Inconel >40HRC)	65 - 200	0.0008 - 0.0020	4
Thermoplastic	220 - 510	0.0012 - 0.0050	1
Cobalt/Chrome Alloy (Stellite)	65 - 200	0.0016 - 0.0060	3

For chip loads, the smaller cutter diameters use a smaller chip load per tooth within a given range.
 Larger cutter diameters use the larger chip load per tooth within the given range.
 For programming help or other information, please contact our Engineering Department at 800-837-2223.

List 41200/41300 - EXOCARB® Thread Mill Mini

Work Material	Thread Sizes Under #2/M2			Thread Sizes #2/M2 & Larger		
	SFM	Feed Rate (Inch/Tooth)	No. of Passes	SFM	Feed Rate (Inch/Tooth)	No. of Passes
Low Carbon Steel	200 - 300	0.0008 - 0.0020	2	200 - 300	0.0008 - 0.0030	1

ABOUT OSG

DRILLING

THREADING

MILLING

HOLDERS

INDEX

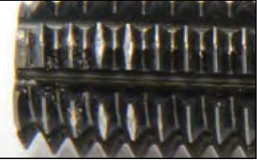

PROBLEM	CAUSE	SOLUTION
Chip Packing (Back Threaded Portion) 	Inappropriate spindle speed	Adjust RPM (lower or higher) for proper chip form
	Helix angle too large	Decrease helix angle or choose tap with low helix angle
	Chips not coiling / breaking properly	Use alternate coating
Chip Packing (Single Thread) 	*Occurs predominantly in horizontal applications*	
	Weak rake angle (positive)	Decrease rake angle
	Chips not evacuating properly	Use a POT style tap or a LHH / RHF
Chipping During Reversal 	Chips left behind in flute during tap reversal	Improve wear resistance of tap
		Improve / add surface treatment / coating
	Material shrinkage	Increase coolant volume / concentration to control heat
Chipping Due to Wear 	Tap substrate not suitable for work material	Improve wear resistance of tap
		Improve / add surface treatment / coating
	Cutting action work hardened material	Shorten chamfer length
Chipping of Land Edge 	Occurs when tap either hits bottom or entrance of hole	Avoid hitting the bottom of the hole, check stroke length, alignment and hole size
Chipping of Land Axially 	Occurs when tap either hits bottom or entrance of hole	Avoid hitting the bottom of the hole, check stroke length, alignment and hole size
Chipping of Chamfer 	Tap substrate not suitable for work material	Improve wear resistance of tap
	Inappropriate pre-drill size	Select suitable pre-drill size

PROBLEM	CAUSE	SOLUTION
Premature Tap Wear 	Inappropriate spindle speed	Reduce spindle speed
	Possible work hardening of pre-drilled hole	Prevent work hardening of pre-drilled hole
	Inappropriate thread relief	Use proper thread relief
	Inappropriate chamfer length	Adjust chamfer length
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
Welding / Galling 	Inappropriate spindle speed	Reduce spindle speed
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
Deformed Lobes 	Possible work hardening of pre-drilled hole	Prevent work hardening of pre-drilled hole
	Inappropriate spindle speed	Reduce spindle speed
	Inappropriate pre-drill size	Increase pre-drill hole size as much as possible
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
		Tap substrate not suitable for material
Tap Breakage 	Possible chip packing	Avoid chip packing
	Inappropriate pre-drill size	Increase pre-drill hole size as much as possible
	Inappropriate spindle speed	Reduce spindle speed
	Possible runout or tapered hole	Reduce runout and assure hole is straight
	Too high of torque generated	Use tap holder with torque adjustment / limiting feature
	Possible tap collision with bottom of hole	Avoid hitting the bottom of the hole, check stroke length, alignment and hole size
Overcutting / Oversized Threads 	Inconsistent feed of spiral fluted style tap	Use compensating tension / compression tap holder Adjust feed rate appropriately Check CNC program
		Inconsistent feed of spiral pointed style tap
Tearing on Flanks 	Inappropriate thread relief / rake angle	Use sharper / freer cutting relief and angle
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
Extremely Torn Threads 	Possible welding / galling	Select appropriate cutting conditions
	Possible chip packing	Select appropriate cutting conditions
	Inappropriate thread relief	Use sharper thread relief
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
Chips Remain at Bottom 	Inappropriate geometry of tap	Reduce chamfer relief angle
		Use thinner land width
		Reduce chamfer length
		Reduce cutting angle

MILLING

MILLING

The A Brand

OSG's premium tooling brand. Features products that are designed to exceed the evolving manufacturing needs of our customers.

EXOPRO[®]

OSG's ultra-premium tooling series, featuring our latest innovative technologies when the absolute best performance is needed.

EXOCARB[®] *WXL*[®]

The new standard in high performance end mills for high speed machining, featuring our WXL[®] nanocoating technology.

EXOCARB[®] *WXS*[®]

The new standard in high performance end mills for hard milling, featuring our WXS[®] nanocoating technology.

EXOCARB[®] *MAX*

Maximum performance end mills designed exclusively for hard milling. Features technologies including WXS[®] and CBN.

EXOCARB[®] *DIAMOND*

OSG's patented CVD diamond coated end mills for die/mold and aerospace applications in non-ferrous materials like graphite, aluminum and CFRP.

EXOCARB[®] *AERO*

High performance carbide end mills for aircraft materials.

HY-PRO[®] *CARB*

Performance sub-micrograin carbide end mills with OSG TiAlN coating. The perfect blend of performance and cost-efficiency.

CARBIDE

All-purpose micrograin carbide end mills for general machining applications.

OSG *PHOENIX*[®]

OSG's high performance indexable tooling for rough and finish milling in a variety of applications.

EXOCARB[®] *DISC CUTTER S*

OSG's patented face mill for high feed, roughing applications on low horsepower machine spindles.

EXOCARB[®] *DISC CUTTER PRO*

OSG's patented face mill for high feed, finishing applications on low horsepower machine spindles.

Type 1

Type 2

Right Angle Type for Milling Straight Corners

Right Angle Type
AE-VMSS, VMS(-RA)

Straight corners with no uncut residue.

Square Type
AE-VMSS, VMS

Choose the right angle type for milling straight corners!

Choose the square type for high processing efficiency!

Type 2

Right Angle Type for Milling Straight Corners

Right Angle Type
AE-VMSS, VMS(-RA)

Straight corners with no uncut residue.

Square Type
AE-VMSS, VMS

Choose the right angle type for milling straight corners!

Choose the square type for high processing efficiency!

See page 6 for details

DESIGNATION EXPLANATION

PFR 0250 R 015 A-ST XP3225

See Full Detail on Pages 1522-1523

CONTINUED ➔

Insert Grade	P	M	K	N	S	H
	Steel	Stainless Steel	Cast Iron	Non-Ferrous	HRSA	Hardened Steel
XC4505				⊙		
XP3225	⊙	⊙	○	⊙	⊙	○
XP3310	○	○	⊙			⊙

XP3225 best recommended when L/D ≥ 5.

XP3310 best recommended for interrupted cutting.

XP3225 best recommended for aluminum applications.

XP4505 best recommended for graphite & CFRP applications.

DESIGNATION EXPLANATION

PFR 0250 R 015 A-ST XP3225

See Full Detail on Pages 1522-1523

Insert Grade	P	M	K	N	S	H
	Steel	Stainless Steel	Cast Iron	Non-Ferrous	HRSAs	Hardened Steel
XC4505				⊙		
XP3225	⊙	⊙	○	⊙	⊙	○
XP3310	○	○	⊙			⊙

XP3225 best recommended when L/D ≥ 5.
 XP3310 best recommended for interrupted cutting.
 XP3225 best recommended for aluminum applications.
 XP4505 best recommended for graphite & CFRP applications.

○ Good ⊙ Best

- The above milling condition is a guideline for overhang length 3xD.
- Use a rigid and precise machine and holder.
- The rotational speed is calculated by the median of the recommended cutting speed. Adjustments may be necessary depending on the rigidity of the workpiece, fixture, and machine.
- Please use a suitable fluid with high smoke retardant properties.
- During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
- Please use water-soluble coolant when machining stainless steel.
- Reduce speed and feed as well as depth of cut when high precision is required.
- Adjust the speed and feed accordingly when the overhang length is longer than specified (refer to Parameter Reduction Chart below).

- The above milling condition is a guideline for overhang length $3 \times D$.
- Use a rigid and precise machine and holder.
- The rotational speed is calculated by the median of the recommended cutting speed. Adjustments may be necessary depending on the rigidity or the workpiece, fixture, and machine.
- Please use a suitable fluid with high smoke retardant properties.
- During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
- Please use water-soluble coolant when machining stainless steel.
- Reduce speed and feed as well as depth of cut when high precision is required.
- Adjust the speed and feed accordingly when the overhang length is longer than specified (refer to Parameter Reduction Chart previous page).

1. Use a rigid and precise machine and holder.
2. The rotational speed is calculated by the median of the recommended cutting speed.
Adjustment may be necessary depending on the rigidity of the workpiece fixture and machine.
3. Please use a suitable fluid with high smoke retardant properties.
4. During dry (no fluid) milling, please use air blow to remove disposable chips from the milling area and to eliminate chip packing.
5. Please use water-soluble coolant when machining stainless steel, precipitation stainless steel, titanium alloy, Ni-based alloy.
6. Reduce speed and feed as well as depth of cut when high precision is required.

1. The above milling condition is a guideline for overhang length 5xD.
2. Use a rigid and precise machine and holder.
3. Please use a suitable fluid with high smoke retardant properties.
4. During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
5. Please use water-soluble coolant when machining stainless steel, precipitation stainless steel, titanium alloy, Ni-based alloy.
6. Reduce speed and feed as well as depth of cut when high precision is required.
7. Adjust the speed and feed accordingly when the overhang length is longer than specified (refer to Parameter Reduction Chart below).

1. Use a rigid and precise machine and holder.
2. The rotational speed is calculated by the median of the recommended cutting speed.
3. Please use a suitable fluid with smoke retardant properties.
4. During dry (no fluid) milling, please use air blow to remove disposable chips from the milling area and to eliminate chip packing.
5. Please use water soluble coolant when machining stainless steel, precipitation stainless steel, and titanium alloy.
6. Reduce speed and feed as well as depth of cut when high precision is required.

1. Tools can cause sparks. Do not use flammable fluids.
2. Use an air blow or a suitable cutting fluid with high smoke retardant properties.

1. The above milling condition is a guideline for the overhang length is 4xD.
2. Use a rigid and precise machine and holder.
3. The indicated speeds and feeds are for milling with water-soluble coolant.
4. Please adjust the speed and feed when the cutting depth is large or when machines with low rigidity are used.
5. Reduce speed and feed as well as depth of cut when high precision is required.
6. Adjust the speed and feed accordingly when the overhang length is longer than specified (refer to p.1352).
7. Please always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys.
Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.

5.6	11,500	28.3	5,600	14.6	4,100	6.7	3,500	5.1										

1. Use a rigid and precise machine and holder.
 2. When chattering occurs, reduce the speed and feed simultaneously.
 3. Use a suitable cutting fluid with high smoke retardant.
- *Maximum speed will vary by diameter.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. Use a suitable cutting fluid with high smoke retardant.
3. When the length of tool extension from the machine is long, reduce the speed and feed.

1. Use a rigid and precise machine and holder.
 2. When chattering occurs, reduce the speed and feed simultaneously.
 3. Use a suitable cutting fluid with high smoke retardant.
- * Maximum speed will vary by diameter.

1. Use a rigid and precise machine and holder.
 2. When chattering occurs, reduce the speed and feed simultaneously.
 3. Use a suitable cutting fluid with high smoke retardant.
- * Maximum speed will vary by diameter.

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.
4. When length of the tool extension from the machine is long, reduce the speed and feed.

1. Use a rigid and precise machine and holder.
2. We suggest using an air blow or MQL (Mist).
3. When using low speed machines, use the maximum speed and adjust feedrate.
4. During heavy load operations such as corner processing, reduce the speed and feed.
5. The run out of the end mill should be within 10 microns (0.0004")

1. Please reduce speed and feed by 20% when L/D > 3D.
2. Please reduce speed and feed by 30% when slotting > 0.5D.
3. Please reduce depth of cut if running at elevated speed and feed.

3/8	2,500	8	2,500	12
1/2	1,880	6	1,880	9

Set the ramping angle to be approximately 3°.

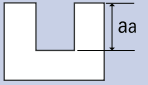

1. Adjust the speed, the feed rate, and the depth of cut to suit your operating conditions, such as the milling shape, machine rigidity, tool holder rigidity, and work holding force.
2. If you are unable to reach the speed and feed rate indicated in the table above, lower the speed and feed rate using the same ratio.
3. If the workpiece gets chipped or if the operation requires a higher level of milling precision, lower the feed rate as necessary.
4. Depending on the shape, if the workpiece chatters, lower the speed and feed rate using the same ratio.
5. To mill graphite, use a dedicated milling machine. To prevent inhalation of dust, use a dust collector and a dust mask when working around graphite.
6. During milling, keep the runout at the tip of the end mill to be less than 0.0004 inches (0.01 mm).
7. If a cut involves the shaping of a corner during side milling, use the corner radius process of the program, or adjust the speed so that it will not cause chattering, and reduce the speed at the corner at the same time (approximately 40%).

1. Use a rigid and precise machine and holder.
2. The indicated speeds and feeds are for milling with water-soluble coolant.
3. Please adjust the speed and feed when the cutting depth is large or when machines with low rigidity are used.
4. Reduce speed and feed as well as depth of cut when high precision is required.
5. Always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys.
6. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.

1	1,400	12.6	1,400	12.6	800	4.8

1. Use a rigid and precise machine and holder.
2. The indicated speeds and feeds are for milling with water-soluble coolant.
3. Please adjust the speed and feed when the cutting depth is large or when machines with low rigidity are used.
4. Reduce speed and feed as well as depth of cut when high precision is required.
5. Always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys.
6. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.

- The above milling condition is a guideline for L/D ratio 1.25 and 1.5.
- Use a rigid and precise machine and holder.
- The rotational speed is calculated by the median of the recommended cutting speed.
Adjustments may be necessary depending on the rigidity of the workpiece, fixture, and machine.
- Please use a suitable fluid with high smoke retardant properties.
- During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
- Please use water-soluble coolant when machining stainless steel and titanium alloy.
- Reduce speed and feed as well as depth of cut when high precision is required.

- The above milling condition is a guideline for L/D ratio 1.25 and 1.5.
- Use a rigid and precise machine and holder.
- The rotational speed is calculated by the median of the recommended cutting speed.
Adjustments may be necessary depending on the rigidity of the workpiece, fixture, and machine.
- Please use a suitable fluid with high smoke retardant properties.
- During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
- Please use water-soluble coolant when machining stainless steel and titanium alloy.
- Reduce speed and feed as well as depth of cut when high precision is required.

1. Increase speeds & feeds 5-10% for Series 412 and 422.
2. Reduce speeds & feeds 20-30% for Series 462.
3. Reduce speeds & feeds 40-50% for Series 482.
4. Increase speeds & feeds 20-30% for 402 TiN.
5. Column for Hardened Steels (40-50 HRC) is for Series 402 TiN and 403 TiN only.
6. Increase speeds & feeds 20-30% for Series 403 and 445.
7. Increase speeds & feeds 20-40% for Series 403 TiN.

Standard 4 Flute and Multiple Flute Carbide

1. Reduce speeds & feeds 20-30% for Series 464.
2. Reduce speeds & feeds 40-50% for Series 484.
3. Slotting is not recommended for Series 484.
4. Increase speeds & feeds 20-30 % for Series 404 TiN.
5. Column for Hardened Steels (40-50 HRC), is for Series 404 TiN only.

- 1) Speeds and Feeds for Lists 520, 522, 540, 541, 542, 543, 548, 620 and 641
- 2) Reduce Speeds and Feeds 5-10% for Lists 525, 527, 547
- 3) Reduce Speeds and Feeds 10-20% for Lists 545 and 557
- 4) Increase Speeds and Feeds 5-15% for Lists 530 and 535 (Aluminum only)
- 5) Increase Speeds and Feeds 10-20% for List 529
- 6) Speeds can be increased up to 20% for 520TiN, 522TiN, 540TiN, and 542TiN
- 7) Speeds can be increased up to 15% for Lists 541TiN/TiCN and 548 TiCN

1. The above milling condition is a guideline for overhang length 3D.
2. Use a rigid and precise machine and holder.
3. Please use a suitable fluid with high smoke retardant properties.
4. During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
5. Please use water-soluble coolant when machining stainless steel./6. Reduce speed and feed as well as depth of cut when high precision is required.
7. Adjust the speed and feed accordingly when the overhang length is longer than specified (refer to Parameter Reduction Chart on next page).

1. Use a rigid and precise machine and holder.
2. The rotational speed is calculated by the median of the recommended cutting speed.
3. Adjustments may be necessary depending on the rigidity or the workpiece, fixture, and machine.
4. Please use a suitable fluid with high smoke retardant properties.
5. During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
6. Please use water-soluble coolant when machining stainless steel.
7. Reduce speed and feed as well as depth of cut when high precision is required.

1. Use a rigid and precise machine and holder.
2. When machining carbon steels or hardened steels, using MQL (Minimum Quantity Lubrication / mist coolant) is recommended.
3. The above condition shows an approximate standard for contouring operation (side milling) with a low machining load.
If abnormal cutting sounds, vibration or chattering occur depending on the machining shape, cutting amount, rigidity of the machine or work holding condition, etc., please adjust the speed, feed and the depth of cut.
4. Adjust the speed, feed rate, and depth of cut if chattering, vibration or abnormal grinding sounds occur.
5. Helical or ramp milling is recommended during the

A Brand AE-CPR4-H

Advanced Performance Four-Fluted Long Neck Corner Radius End Mill for Hardened Steels

- Use a rigid and precise machine and holder.
- When machining carbon steels or hardened steels, using MQL (Minimum Quantity Lubrication / mist coolant) is recommended.
- The above condition shows an approximate standard for contouring operation (side milling) with a low machining load.
If abnormal cutting sounds, vibration or chattering occur depending on the machining shape, cutting amount, rigidity of the machine or work holding condition, etc., please adjust the speed, feed and the depth of cut.
- Adjust the speed, feed rate, and depth of cut if chattering, vibration or abnormal grinding sounds occur.
- Helical or ramp milling is recommended during the approach of a Z cut.
- When using a tool with a diameter of $\phi 0.5$ or less, or L/D (aspect ratio) is greater than 10, high loads can cause tool breakage.
Therefore, adjust the cutting conditions based on the machining situation.
- When RPM are insufficient, please reduce the RPM and feed rates at same ratio as listed above.

1. Adjust the speed, feed, and plunge depth in accordance with operating conditions, including the machining shape, machine rigidity, holder rigidity, and work holding force.
2. If the speed and feed rates cannot increase due to equipment performance, operate by reducing the speed and feed rates at the same ratio.
3. High cutting speeds and feed rates can cause cutter wear or reduce machining precision. Therefore, operate by reducing the feed rate as needed.
4. Depending on the shape to be machined, if the end mill chatters during machining, it can bite into the shape. Therefore, operate by reducing the speed and feed rates at the same ratio.
5. For precise, detailed machining, use a dedicated machine that operates quietly.
6. Operate by keeping the runout at the tip of the end mill below 5 microns (.0002").
7. To perform finish machining with a high level of efficiency, keep the speed and feed rates below 2 times.
8. To finish a flat surface, operate at a speed range with a minimal amount of equipment vibration, making sure that the feed rate does not cause the equipment to wobble.
9. To finish machine a curved surface using the corner radius tool, operate by changing the machining pitch.
10. Set the inclined cut angle approximately between 0.3° and 0.5°.

1. The above mentioned conditions according to projection lengths are intended as general guidelines for reference only. Adjustments should be made based on actual milling conditions.
2. Highly rigid machines and tool holders should be used.
3. Tool vibrations should be kept at a minimum level for maximum accuracy.
4. In the case of linear machining, do not use the Ar value, instead refer to the Aa value.
5. Under general machining conditions, air-blow cutting method is recommended.
6. More stable high-feed machining in the corners can be attained by setting an R insertion or deceleration on the CAM or machine side.
7. When cutting load fluctuates (in the corners, etc.) or when high-precision is required, be sure to control the rotational speed.
8. When cutting at greater than the recommended cutting angle, reduce the feed.
9. When the depth of cut is less than the specified amount as listed above, the feed rate can be increased up to 150%.
10. When the depth of cut is greater than the specified amount as listed above, the feed rate can be reduced by no more than 60% to ensure stable milling.

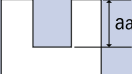

List 2055 - EXOPRO® UVX-Ni : 5 Flute - Corner Radius

Side Milling

Hardness		
Work Material	High Temp. Alloys Inconel Hastelloy	
Cutting Speed	125-150 SFM	
Depth of Cut	$aa \leq 0.5D$ $ar \leq 0.3D$ 	
Mill Dia.	Speed RPM	Feed in/min
1/4	2,100	11.0
5/16	1,600	10.0
3/8	1,400	10.0
1/2	1,100	9.5
5/8	800	9.0
3/4	650	8.0
1	500	7.0

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed.
3. Use a suitable cutting fluid with high smoke retardant.

Slotting

Hardness		
Work Material	High Temp. Alloys Inconel Hastelloy	
Cutting Speed	75-100 SFM	
Depth of Cut	$aa \leq 0.5D$ 	
Mill Dia.	Speed RPM	Feed in/min
1/4	1,300	7.0
5/16	1,000	6.5
3/8	900	6.0
1/2	700	5.5
5/8	500	5.0
3/4	400	4.5
1	300	4.0

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. These milling conditions are based on milling with circular interpolation at corners; for milling without circular interpolation (such as right angle cornering), reduce the speed to 50-70% and the cutting depth to 50-80% of the above conditions.
3. We recommend using air blow or MQL (mist).
4. Please adjust the speed, feed and cutting depth according to actual cutting conditions.
5. When entering into the part, reduce the feed to 30-60% of the above conditions, with a ramping angle < 2°.
6. These milling conditions are for a tool overhang less than 4xD; for longer overhangs, reduce the speed, feed and cutting depth to prevent chattering.

1. This tool is recommended for the roughing of additive manufacturing and mold overlay surfaces.
2. Please use machines and holders that are rigid and highly accurate.
3. The values listed above are for reference. Please set the cutting condition in accordance with the actual machining environment.
4. Please reduce the feed rate when the depth of cut is greater than specified.
5. Please adjust the speed, feed and depth of cut accordingly when the overhang length is longer than specified.
6. Please use a suitable fluid with high smoke retardant properties.
7. During dry (no fluid) milling, please use air blow to remove disposable chips from the milling area and to eliminate chip packing.
8. Please use water-soluble coolant when machining stainless steel, cobalt-chromium based alloy, titanium alloy, and Ni-based alloy.
9. Tool runout should be kept to a minimum for maximum accuracy.
10. When the cutting load fluctuates in areas such as the corners, please reduce the rotational speed.

3.0	0.05	0.6	13,900	22.1	12,130	22.0	9,540	15.0

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. When using low speed machines, use the maximum speed and adjust feed rate.
4. During heavy load operations such as corner processing, reduce the speed and feed.
5. The run out of the end mill should be within 10 microns (.0004") after chucking.

1/2	0.030	1,880	9	1,880	6
1/2	0.060	1,880	9	1,880	6

Set the ramping angle to be approximately between 0.3° and 0.5°.

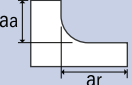

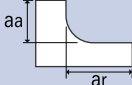

1. Adjust the speed, the feed rate, and the depth of cut to suit your operating conditions, such as the milling shape, machine rigidity, tool holder rigidity, and work holding force.
2. If you are unable to reach the speed and feed rate indicated in the table above, lower the speed and feed rate using the same ratio.
3. If the workpiece gets chipped or if the operation requires a higher level of milling precision, lower the feed rate as necessary.
4. Depending on the shape, if the workpiece chatters, lower the speed and feed rate using the same ratio.
5. To mill graphite, use a dedicated milling machine. To prevent inhalation of dust, use a dust collector and a dust mask when working around graphite.
6. During milling, keep the runout at the tip of the end mill to be less than 0.0004 inches (0.01 mm).
7. When making a rough cut with a 3/16" or greater end mill, you can feed as high as triple the recommended feed rate provided the stepdown is less than the corner radius.
8. If a cut involves the shaping of a corner during side milling, use the corner radius process of the program, or adjust the speed so that it will not cause chattering, and reduce the speed at the corner at the same time (approximately 60%).

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. The above parameters are standard starting values for contouring and side milling operations. If vibration or chatter occurs due to machine or part setup, please adjust the speed, feed, and depth of cut accordingly.
4. If the cutting depth is small it is possible to increase the speed and feed above the recommended parameters.

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. Use air blow or a suitable cutting fluid with high smoke retardant properties.
4. The above parameters are for contouring operations with stable conditions and setup. Adjustment may be required in less optimal situations.
5. Please adjust parameters based on machine accuracy, part shape, and tool path.
6. When using a tool with diameter 0.5mm or below or when L/D ratio is above 10 unstable or aggressive milling may result in tool breakage. Please adjust parameters based on the machine setup.
7. If unable to achieve the recommended RPM above please reduce the speed and feed by the same proportion. Axial and radial depth may remain as specified in the table.

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. The above parameters are applicable to an overhang of 4xD maximum. When the overhang is longer, please reduce feed, speed, and cutting depth.
4. The above parameters are standard starting values for contouring and side milling operations. If vibration or chatter occurs due to machine or part setup, please adjust the speed, feed, and depth of cut accordingly.
5. If contouring includes corners of radius less than 1.5 times the tool diameter, reduce speed and feed to 50-80% of above and reduce Ar to 20-60% of above.
6. When the part incline angle (β) is more than 15°, reduce the speed to 40-60% of above parameters, the feed to 30-50% of above parameters, and Aa to 30-60% of above parameters.
7. If the cutting depth is small it is possible to increase the speed and feed above the recommended parameters.

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. The above parameters are applicable to an overhang of 4xD maximum. When the overhang is longer, please reduce feed, speed, and cutting depth.
4. The above parameters are standard starting values for contouring and side milling operations. If vibration or chatter occurs due to machine or part setup, please adjust the speed, feed, and depth of cut accordingly.
5. If contouring includes corners of radius less than 1.5 times the tool diameter, reduce speed and feed to 50-80% of above and reduce Ar to 20-60% of above.
6. When the part incline angle (β) is more than 15°, reduce the speed to 40-60% of above parameters, the feed to 30-50% of above parameters, and Aa to 30-60% of above parameters.
7. If the cutting depth is small it is possible to increase the speed and feed above the recommended parameters.

1. Use a rigid and precise machine and holder.
2. Please adjust the speed and feed when the cutting depth is large or when machines with low rigidity are used.
3. Use a water soluble fluid.
4. Use a non-water-soluble cutting fluid if the machined surface and accuracy are of critical importance.
5. Always use a cutting fluid recommended by the cutting fluid manufacturer as the workpiece may discolor.

- The above mentioned conditions according to projection lengths are intended as general guidelines for reference only. Adjustments should be made based on actual milling conditions.
- For 0.5R - 2.5R, the machining conditions are based on chucking the tool up to the base of the neck.
- Highly rigid machines and tool holders should be used.
- Tool vibrations should be kept at a minimum level for maximum accuracy.
- In the case of linear machining, do not use the Ar value, instead refer to the Aa value.
- More stable high-feed machining in the corners can be attained by setting an R insertion or deceleration on the CAM or machine side.
- When cutting load fluctuates (in the corners, etc.) or when high-precision is required, be sure to control the rotational speed.
- When cutting at greater than the recommended cutting angle, reduce the feed.

1. The above mentioned conditions according to projection lengths are intended as general guidelines for reference only. Adjustments should be made based on actual milling conditions.
2. For 0.5R - 2.5R, the machining conditions are based on chucking the tool up to the base of the neck.
3. Highly rigid machines and tool holders should be used.
4. Tool vibrations should be kept at a minimum level for maximum accuracy.
5. In the case of linear machining, do not use the Ar value, instead refer to the Aa value.
6. More stable high-feed machining in the corners can be attained by setting an R insertion or deceleration on the CAM or machine side.
7. When cutting load fluctuates (in the corners, etc.) or when high-precision is required, be sure to control the rotational speed.
8. When cutting at greater than the recommended cutting angle, reduce the feed.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

Standard Milling

Hardness		-		<32 HRC		33-41 HRC		42-50 HRC

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. Use a suitable cutting fluid with high smoke retardant.
3. When the length of tool extension from the machine is long, reduce the speed and feed.

1. To achieve flute depth, sequential use of each neck length is most effective.
2. When corner processing, reduce the feed rate by approximately half.
3. Use cutting fluid.

1. This tool is recommended for the roughing of additive manufacturing and mold overlay surfaces.
2. Please use machines and holders that are rigid and highly accurate.
3. The values listed above are for reference. Please set the cutting condition in accordance with the actual machining environment.
4. Please reduce the feed rate when the depth of cut is greater than specified.
5. Please adjust the speed, feed and depth of cut accordingly when the overhang length is longer than specified.
6. Please use a suitable fluid with high smoke retardant properties.
7. During dry (no fluid) milling, please use air blow to remove disposable chips from the milling area and to eliminate chip packing.
8. Please use water-soluble coolant when machining stainless steel, cobalt-chromium based alloy, titanium alloy, and Ni-based alloy.
9. Tool runout should be kept to a minimum for maximum accuracy.
10. When the cutting load fluctuates in areas such as the corners, please reduce the rotational speed.

16 (R3 x R500 x 20°)	3300	63.0		2700	43.4		2100	31.5	

1. This chart should be used when machining with the Peripheral Edge Radius, R2.
2. Use a rigid and precise machine and holder.
3. Use a coolant with low air-blow or fuming property according to the work material. MQL (oil mist coolant) is recommended for cutting hardened steels.
4. Using Peripheral Edge Radius (R2)" is the guide to use the intermediate position of peripheral edge radius. Please adjust the rotation speed, feed rate and cutting pitch based on the cutting shape, machine rigidity, workpiece and holding conditions.
5. When chattering, vibration or abnormal cutting noise occurs, please adjust the rotation speed, feed rate and cutting pitch.
6. In order to change the rotation speed, both the rotation speed and the feed rate should be changed at the same ratio.

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. When using low speed machines, use the maximum speed and adjust feed rate.
4. During heavy load operations such as corner processing, reduce the speed and feed.
5. The run out of the end mill should be within 10 microns (.0004") after chucking.

3/8	1,670	8	1,670	8
1/2	1,255	6	1,255	6

Set the ramping angle to be approximately 0.5°.

1. Adjust the speed, the feed rate, and the depth of cut to suit your operating conditions, such as the milling shape, machine rigidity, tool holder rigidity, and work holding force.
2. If you are unable to reach the speed and feed rate indicated in the table above, lower the speed and feed rate using the same ratio.
3. If the workpiece gets chipped or if the operation requires a higher level of milling precision, lower the feed rate as necessary.
4. Depending on the shape, if the workpiece chatters, lower the speed and feed rate using the same ratio.
5. To mill graphite, use a dedicated milling machine. To prevent inhalation of dust, use a dust collector and a dust mask when working around graphite.
6. During milling, keep the runout at the tip of the end mill to be less than 0.0004 inches (0.01 mm).
7. If a cut involves the shaping of a corner, use the corner radius process of the program, or adjust the speed so that it will not cause chattering, and reduce the speed at the corner at the same time (approximately 60%).

1. Increase speeds & feeds 5-10% for Series 412BN, 414BN, 442BN and 444BN.
2. Reduce speeds & feeds 20-30% for Series 462BN and 464BN.
3. Reduce speeds & feeds 40-50% for Series 482BN and 484BN.
4. Increase speeds & feeds 20-30% for Series 402BN TiN and 404BN TiN.
5. Column for Hardened Steels (40-50 HRC) is for 402BN TiN and 404BN TiN only.

1. The conditions listed above are based on approximately 1xDc thickness of part with rigid work holding.
2. Conventional cut is recommended at part side for good surface finish.
3. Milling speed can be increased by 20-50% with the use of appropriate cutting oil.
4. Please provide appropriate measures against dust (Such as vacuum dust collection).
5. Depending on the workpiece thickness and form as well as work holding, vibration may occur. When it occurs, please adjust RPM and feed rate.

1/2	2,500 - 4,000	0.028 - 0.055

1. The conditions listed above are based on approximately 1xDc thickness of part with rigid work holding.
2. Conventional cut is recommended at part side for good surface finish.
3. Milling speed can be increased by 20-50% with the use of appropriate cutting oil.
4. Please provide appropriate measures against dust (Such as vacuum dust collection).
5. Depending on the workpiece thickness and form as well as work holding, vibration may occur. When it occurs, please adjust RPM and feed rate.

Feed Reduction

Material Thickness	Feed Reduction
$\leq 0.25D$	x80%
0.25D ~ 0.5D	x150%
0.5D ~ 1D	x120%
1D ~ 2D	x80%
2D ~ 3D	x50%

Styles of Cut

Medium Tough Cut

Engineered specifically for tough applications. Tough cut insures faster, splinter-free cutting in weld and alloy castings with increased tool life.

Medium Right Hand Spiral

General purpose - Recommended for stock removal and a smooth finish.

Aluminum Cut

Designed for use on aluminum, non-ferrous metals, soft steel, reinforced plastics, and other soft materials.

Coarse and Fine Cuts are available on request.

Recommended Cutting Speeds for Carbide Burs

Diameter	RPM	Max RPM
1/16"	55,000 - 85,000	90,000
3/32"	50,000 - 60,000	85,000
1/8"	35,000 - 65,000	80,000
3/16"	30,000 - 55,000	75,000
1/4"	25,000 - 50,000	70,000
5/16"	18,000 - 38,000	65,000
3/8"	17,000 - 38,000	63,000
7/16"	13,000 - 37,000	55,000
1/2"	14,000 - 36,000	50,000
5/8"	11,000 - 23,000	40,000
3/4"	8,000 - 19,000	30,000
1"	7,000 - 18,000	25,000

Note: Use lower speeds when cutting harder ferrous materials and higher speeds for softer non-ferrous materials.

Type of Insert

Material Class	Grade	Coating Method	Hardness (HRA)	Surface Treatment		Features
				Main Component	Coating Thickness	
P	XC3020	CVD	90.5	TiCN + Al ₂ O ₃	10 μm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistance coating.
	XP3025	PVD	90.5	TiAlN	5 μm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistance coating.
	XC3025	CVD	90.8	TiCN + TiN + Al ₂ O ₃	4 μm	For Machining Steel, Stainless Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XC3030	CVD	89.5	TiCN + Al ₂ O ₃	10 μm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3035	PVD	89.5	TiAlN	5 μm	For Machining Steel, Stainless Steel and Cast Iron A grade for general purpose milling. Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3930	PVD	90.8	TiAlN	3 μm	For Machining Steel, Stainless Steel and Cast Iron Excellent balance; can accommodate a wide range of workpiece materials.
	XP8030	PVD	91.9	TiAlN	3 μm	For machining steel and stainless steel Excellent balance of wear-resistance and chipping-resistance; can accommodate a wide range of workpiece materials.
	XC8035	CVD	89.6	TiCN + Al ₂ O ₃	7 μm	For machining steel and cast iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3225	PVD	91.5	Cr	3 μm	For Machining Steel, Stainless Steel and Cast Iron Composed of a tough carbide material with an excellent general purpose coating.
	XP3310	PVD	92.5	SiC Silicon-based heat-resistant coating	3 μm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3320	PVD	91.5	SiC Silicon-based heat-resistant coating	3 μm	For Machining Steel, Stainless Steel and Cast Iron Composed of a tough carbide material with a heat-resistant and wear-resistant coating.
	M	XP2025	PVD	91.0	TiAlN	5 μm
XP2040		PVD	89.6	TiAlN	5 μm	For Machining Stainless Steel and Steel Ideal for general-purpose milling. Composed of a tough, high-strength carbide with an anti-chipping and wear-resistant coating.
XP2225		PVD	91.5	Cr	3 μm	For machining stainless steel Composed of a heat-resistant carbide material with a heat-resistant and wear-resistant coating.
K	XC1015	CVD	91.5	TiCN + Al ₂ O ₃	10 μm	For Machining Cast Iron Composed of a tough, high-strength carbide material with an anti-chipping and wear-resistant coating.
	XP1020	PVD	91.5	TiAlN	5 μm	For Machining Cast Iron Composed of a tough, high-strength carbide material with an anti-chipping and wear-resistant coating.
N	CK010	-	92.0	-	-	For Machining Non-Ferrous Materials Composed of a non-coated carbide material with an anti-chipping and wear-resistant properties.
	XC4505	CVD	93.0	DIA	12 μm	For Machining Non-Ferrous Materials Micro crystal diamond provides a coating layer with excellent strength.
S	XC5035	CVD	89.3	TiN + Ti(CN) + Al ₂ O ₃ + Ti(BN)	6 μm	For Machining Heat-Resistant Alloy and Stainless Steel Composed of a tough carbide material with an oxidation-resistant and high-lubricity coating.
	XC5040	CVD	89.3	TiN + TiB ₂	4 μm	For Machining Heat-Resistant Alloy and Stainless Steel Can be used for wet machining. Composed of a tough carbide material with an oxidation-resistant and high-lubricity coating.
H	XP6015	PVD	92.2	TiAlN	4 μm	For Machining High Hardness Steel Composed of a tough, high-strength carbide material with a wear-resistant coating.
	XP6305	PVD	93.0	SiC Silicon-based heat-resistant coating	3 μm	For Machining High Hardness Steel Composed of a tough, high-strength carbide material with excellent thermal conductivity.

Cast Iron & Ductile Iron

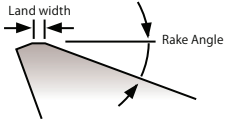

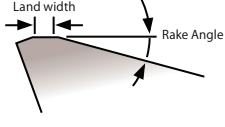

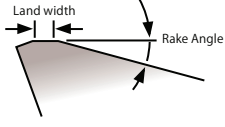

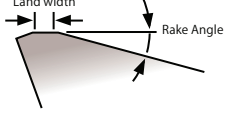

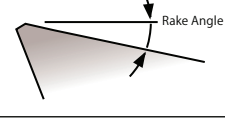

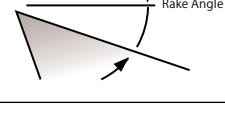

Stainless Steel

Type of Chip Breaker

Machining Method	Chip Breaker	Cutting Edge Cross-Section (Approximate)	Application
Milling	GL		For milling stainless steel: a breaker with a large rake angle and a small flat land to reduce cutting force.
	GM		For milling various materials from steel to cast iron: a breaker with a superior balance of rake angle and flat land.
	GR		For milling various materials from steel to cast iron: a highly rigid breaker with large rake angle and flat and to provide a sharp cutting edge and enable efficient milling.
	HR		For milling high hardened steel: a breaker with sharpness and excellent rigidity.
	SM		For milling difficult materials: a breaker with a sharp cutting edge to reduce cutting force and provide smooth chip evacuation.
	NM		For milling non-ferrous materials: a breaker with a sharp cutting edge and a large rake angle to suppress welding, improve the milling surface and prevent burrs.

Cutting Conditions Adjustment Ratio

Depth of Cut Aa	Width of Cut Ar Max	Milling Speed Ratio	Feed Rate Ratio
< 0.2D	1D	0.8	0.5
0.25-0.3D	0.7D	0.8	0.6
0.4-0.5D	0.5D	0.9	0.7
0.6-0.7D	0.3D	0.9	0.8
0.8-1.0D	0.2D	1.0	0.9
1.1-1.5D	0.1D	1.0	1.0

Ex: For Ø1.250" PSEL with ZDKT11 inserts, Aa = 1.150", side milling in 1050 carbon steel:
 Vc = 492 SFM x 1.0 = 492 SFM
 fz = 0.008 in/t x 0.9 = 0.007 in/t
 Ar = 0.2 x 1.250" = 0.250" Max

Adjusting Cutting Edge Height

Names of Components:

1. Confirm Wedge Position

Check and ensure that all wedges are in the correct position. Make adjustments when necessary.

Correct

Incorrect

2. Mounting of Blades

Mount one wiper blade (FR1204-W) to the wiper blade position indicator and the normal blades (FR1204 or FR1206) to the remaining positions. Using the T-Wrench (A), tighten the clamp screw completely to 10 Nm.

Wiper Blade Position Indicator

3. Measurement of Cutting Edge Height

Measure all of the cutting edge heights and determine the highest normal cutting edge.

4. Adjustment of Normal Blades

Adjust all other normal cutting edges to match the highest normal cutting edge height. The offset should be within 0.005mm. To lift the wedges, use the L-Wrench (B) to turn the wedge screw clockwise.

5. Adjustment of Wiper Blade

Use the L-Wrench (B) to adjust the wiper blade so that it is 0.02 - 0.04mm higher than the other normal blades.

Cutting Edge Position of the Wiper Blade

The wiper blade is automatically set to be 0.8mm closer to the interior than the normal blade. Based on this design, only the bottom of the wiper edge is used during processing, thus enabling a high quality surface finish even in high depth (A_p) milling.

Cautions During Use

- Blades can be adjusted by lifting upward only.
- Maximum adjustment is 0.6mm.
- When the maximum adjustment limit is reached, remove the blade and start over from step (1).
- When measuring the edge height using a contact tool presetter with a touch probe, please be cautious to not damage the PCD edge.

No need for Temporary Tightening

Temporary tightening is not required. Cutting edge height can be adjusted after complete tightening of the clamping screw, making the setup process quick and effortless.

Before Clamping

After Clamping

The tightening of the clamping screw pushes sides of the blade outward, locking it tightly in place with the cutter body

After tightening the clamping screw, the blade is locked into position secured by the wedge taper. The wedge assures a fix and unmovable blade position during machining.

Note: Effective cutting diameter is based on cutting depth (Aa)

How to determine effective cutting diameter:

Ex: Dc = 0.500"
Aa = 0.020"
De = 2√(0.020(0.500-0.020))
De = 0.196"

$$De = 2 \sqrt{a_a(D_c - a_a)}$$

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Please adjust the cutting condition when the overhang length is longer.
4. Please consider the overhang length as the total length of replaceable head and overhang length of shank holder.
5. Use an air blow or a suitable cutting fluid with high smoke retardant properties.

1. This tool is recommended for the roughing of additive manufacturing and mold overlay surfaces.
2. Please use machines and holders that are rigid and highly accurate.
3. The values listed above are for reference. Please set the cutting condition in accordance with the actual machining environment.
4. Please reduce the feed rate when the depth of cut is greater than specified.
5. Please adjust the cutting condition when the overhang length is longer.
6. Please use a suitable fluid with high smoke retardant properties.
7. During dry (no fluid) milling, please use air blow to remove disposable chips from the milling area and to eliminate chip packing.
8. Please use water-soluble coolant when machining stainless steel, cobalt-chromium alloy, titanium alloy, and Ni-based alloy.
9. Tool runout should be kept to a minimum for maximum accuracy.
10. When the cutting load fluctuates in areas such as the corners, please reduce the rotational speed.
11. If Ar is greater than 0.5Dc, there may be a cusp in the machined surface.

1. This tool is recommended for the roughing of additive manufacturing and mold overlay surfaces.
2. Please use machines and holders that are rigid and highly accurate.
3. The values listed above are for reference. Please set the cutting condition in accordance with the actual machining environment.
4. Please reduce the feed rate when the depth of cut is greater than specified.
5. Please adjust the cutting condition when the overhang length is longer.
6. Please use a suitable fluid with high smoke retardant properties.
7. During dry (no fluid) milling, please use air blow to remove disposable chips from the milling area and to eliminate chip packing.
8. Please use water-soluble coolant when machining stainless steel, cobalt-chromium alloy, titanium alloy, and Ni-based alloy.
9. Tool runout should be kept to a minimum for maximum accuracy.
10. When the cutting load fluctuates in areas such as the corners, please reduce the rotational speed.
11. If Ar is greater than 0.5Dc, there may be a cusp in the machined surface.

OSG Tool Reconditioning

OSG's Bensenville facility is the special cutting tool and regrinding authority based in the Chicago area. Through accurate and expedient regrinds of high-end cutting tools, OSG helps customers extend tool life and save money by restoring their used cutting tools to their original condition. In addition to regrinding, the Bensenville facility also manufactures custom drills, reamers, and other special cutting tools, performs product modifications and provides premium coating services.

As part of the OSG Corporation (headquartered in Japan), the regrind facility is the only OSG authorized regrinding source in America. The regrinding program uses the same OSG manufacturing drawings, adheres to OSG's strict quality control standards and uses the same equipment for OSG manufacturing and inspection procedures. As one of the world's leading cutting tool manufacturers, OSG offers a global network of support to our customers.

Tool Reconditioning Lowers Costs

The primary benefit of tool reconditioning is clear: the reduction in overall tooling costs. As part of normal production, tool wear, chipping and breakage occurs often affecting tool performance and increasing manufacturing costs. By reconditioning high performance drills, end mills and taps, OSG helps manufacturers realize substantial cost savings through extended tool life without jeopardizing production quality or performance. Because OSG's reconditioned tools are manufactured to the same high level of quality and held to the same exacting standards that new tools are, customers of OSG's tool reconditioning services can expect the same high performance and quality they are accustomed with OSG's new tools even after regrinding multiple times.

Engineering & Sales Support

OSG reconditions OSG tools using the same prints as the original tools made in our plants around the world. By using original part drawings, tools are accurately reconditioned to the original specifications, so customers are assured that reconditioned tools realize the same high level of performance. Manufacturers can also work directly with OSG design engineers to customize tools for enhanced performance or to meet specific requirements.

OSG's national sales team provides tooling expertise in the field for onsite evaluations and recommendations for manufacturers to implement a customized reconditioning program. The goal is to help manufacturers reduce tool costs and inventory, optimize performance and enhance overall profits.

Contact your OSG representative or distributor to review your tool reconditioning program.

CNC Training

OSG CNC technicians are extensively trained on proper setup methodologies and reconditioning processes by an on-staff CNC trainer. Through their development, the CNC technician training program moves operators through three levels where they are diligently monitored and certified/reevaluated annually to maintain consistency and quality in our tools. Technicians are also trained and certified/reevaluated annually by Quality Assurance to perform inspections to print on first piece and in process tools.

Inspector Training

In order to guarantee that our tools are reconditioned to the highest standards, inspectors also undergo annual training and certifications which involve standardized procedures. These are the same methods that are used in the OSG manufacturing facilities in Japan and around the world. Inspectors are trained to inspect and measure tools completely to the original tool prints.

Throughout the reconditioning process, the tools are also continuously inspected until 100% visual inspection ensures that no chipped or defective tools are received by the customer. The high tech inspection equipment used at the reconditioning facility is the same equipment used at all OSG locations. This includes in-house developed tool analyzers and state-of-the-art equipment with up to 300x magnification capabilities. The key to inspecting high performance, accurate reconditioned tools is assuring that they are held to the same inspection standards through the use of the same inspection methods as new OSG tools.

The Bensenville plant is subject to OSG's stringent JQA regrinding standards and is certified regularly by OSG Japan.

Equipment and Facility

In 2015, OSG opened a reconditioning facility which is equipped with state-of-the-art production and inspection equipment. The facility uses high precision 5-Axis CNC grinders throughout the reconditioning process for improved repeatability and precision.

OSG's weekly equipment Preventive Maintenance (PM) program ensures consistency and accuracy throughout the reconditioning process. Through this PM program, OSG's tool reconditioning performance will be consistent year after year.

For center-through coolant system, please insert tool all the way to the back of the collet. Coolant leakage may occur if the tool insertion length is too short. Select the appropriate collet after confirming the dimensions of the tap to be used. Confirm the tightening torque with a torque spanner or similar tool.

Basic	CAT40 CAT50 BT30 BT40 BT50 HSK-E50 HSK-A63 HSK-F63M HSK-A100	Slim Ø3 - 12mm Ø1/8 - 1/2" Regular Ø3 - 12mm Ø1/8 - 1/2"	Carbide End Mills	
	Nozzle		CAT40 CAT50 BT40 BT50 HSK-A63 HSK-A100	

Holders

Type	Specifications	CAT, BT Holders	HSK Holders
Basic Holders	Holder for Shrink Extension	CAT40, CAT50 BT30, BT40, BT50	E50 A63, A100 F63M
Nozzle Holders	Holder for Shrink Extension (with optional coolant supply nozzle)	CAT40, CAT50 BT40, BT50	A63, A100

Extensions

Type	Application	Dimension/Size
Regular Type	For General Operations and Coolant-Through Tool	 inch/metric
Slim Type	Use this type when a slim holder is needed to avoid interference between the tool and the work piece	 inch/metric
Flush Type	Use this type when you want coolant supplied from the end face of the extension	 inch/metric

For Small Shank Diameter use h6 Shanks

The HY-PRO Shrink System can be used for tools with a minimum shank diameter of 1/8" or 3mm. For tools with a shank diameter of $\varnothing 1/4-1/2"$ or $\varnothing 6-12\text{mm}$, the system requires at least an h7 shank tolerance; for tools with a shank diameter of $\varnothing 1/8-3/16"$ or $\varnothing 3-5\text{mm}$, use an h6 shank tolerance. A wide variety of tools are applicable.

Various Coolant Supply Devices

Through the Tool

Suitable when using a tool with internal coolant to supply the point of the cutting edge. This is especially effective for drilling because the coolant is guaranteed to reach the cutting area.

Through the Holder

Supplies coolant from the front face of the holder. This is used for tools without internal coolant and regular or slim type extensions.

Through the Collet

Supplies coolant from the front face of the shrink extensions. Although the diameter of the collet end face increases, coolant supply becomes even more effective.

Do-It-Yourself Extensions

If necessary, the shape of the shrink extension can be easily modified. This design provides the best holder shape for operations that have major interference with work materials.

1. The shape of the flush collet cannot be adjusted.
2. Other adjustments should be based on the ranges described below.
(Wall thickness should be at least 1.5mm)
3. DO NOT change the overall length.
4. For details, please refer to the instruction manual attached to the product package.

Recommended Cutting Conditions for Extension Modification

1. The cutting depth should be kept small.
2. Use water soluble coolant.
3. Use positive-rake inserts for stainless steel.

Cutting Speed (m/min)	Cutting Speed (m/min)	Feed (mm/rev)	Cutting Depth (mm)
Roughing	30 - 50	0.1	0.2
Finishing	30 - 50	0.05	0.1

HY-PRO® Shrink - Proper Care Information

Please follow these guidelines to ensure your HY-PRO® Shrink extensions stay looking and performing like new for years to come:

- When not in use, remove tool and clean/dry the inside & outside of holder as thoroughly as possible. Apply rust-proofing oil (WD-40® for example) to help inhibit oxidation. Excessive internal rusting will lead to hairline fractures in the steel.
- Be sure to use cutters with shank diameters that adhere to ISO tolerance requirements. Remember, HY-PRO® Shrink holders are made to accommodate the following:

Ø1/8-3/16" and Ø3-5mm	→	h6 tolerance ONLY!
Ø1/4-1" and Ø6-25mm	→	h7 tolerance ONLY!

- Failure to use tools that adhere to these standards may result in complications with respect to inserting and removing tools.
- Be sure to observe minimum chucking lengths on extensions. Failure to do so can result in poor accuracy, deformation, or cracking of tool or extension.

Care Tips:

- Simple household bleach will remove oxidation from the outside of extensions. Use it to clean metal powder and debris from the insides as well to help prevent scratching & abrasions.

- Be sure to keep threads on the end of the extensions well oiled to allow for easy installation and removal from the holders.
